BOOSTER SETS

GENERAL INTRODUCTION - PRODUCT DESCRIPTION

Lowara **SPHERE UNIT**, **GXS**, **GMD**, **GTKS** and **GHV**, series booster sets are designed to transfer and increase the pressure of water, in the following applications:

- Public buildings
- Apartment
- Single house
- Condominiums
- Garden irrigation

The booster sets series described upper, are pumping stations assembled with one or two centrifugal pumps.

BG, **CEA**, **HM** pump series, peripheral pumps **P** series, or vertical multistage block pump **VM** series in relation to booster sets type.

The **SPHERE UNIT** is a small boost unit, fixed speed, with one single phase pump, automatic operation, assembled with pressure switch, pressure gauge, junction, membrane tank 24 litres. Product is available with centrifugal horizontal pumps **BG**, **CEA**, **HM** series, and peripheral pumps **P** series.

The booster sets **GXS**, **GMD**, **GTKS** and **GHV** series are pumping stations, single phase or three phase power supply, according to boosters model, assembled with two pumps automatic operation fixed speed (**GXS**, **GMD**) or variable speed (**GTKS**, **GHV**); The pumps are connected to one another by suction and delivery pipes and fixed onto a single base. The pumps are connected to the manifolds by means of stop valves and check valves. An electric protection and control panel is installed using a bracket on the base of the set. Booster sets are available with horizontal centrifugal **BG**, **CEA**, **HM** pump series, or vertical multistage block pump **VM** series in relation to booster sets type.

CHOICE AND SELECTION

The following conditions should be considered when choosing a booster set:

- The system's requirements should be met regarding flow rate and pressure.
- The booster set must not be oversized, avoiding unnecessary installation and running costs.

Generally speaking, the water consumption in water distribution systems, such as DHW circuits for villas, detached houses and the like, is defined as "variable" though it is fairly concentrated during the day in what are known as peak consumption periods. Given the type of residential use, these concentrations of water demand mainly occur in the morning and in the evening.

The definition of the flow for these system types is generally based on practical tables giving the value of daily consumption depending on the type of user (number of occupants, number of services, etc..).

The size of the pressure booster set and, in practice, the performance levels of the pumps and the number of pumps is based on the take-off point and, therefore, on the consumption value which takes the following factors into account:

- The consumption peak
- Yield
- NPSH
- Diaphragm tanks

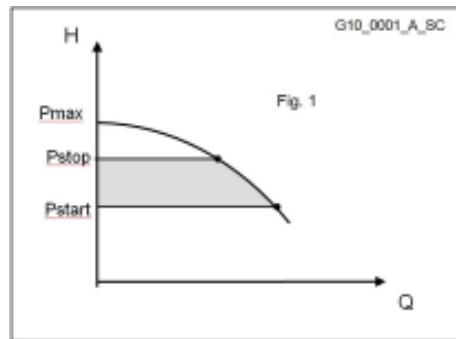

SPHERE UNIT ONE PUMP SET, WITH

FIXED-SPEED MOTORS AND PRESSURE SWITCH CONTROL

The starting and stopping of the pump is determined by the pressure values set on the pressure switch that is connected to the pump. The differential pressure is the difference between starting pressure and switch-off pressure.

Figure 1 shows the operating mode with the pump curve

- On demand, water is drawn from the tank.
- When the pressure drops to the P_{start} value the pump starts.
- When consumption reduces and the pressure increases until it reaches the P_{stop} value, the pump is switched off.

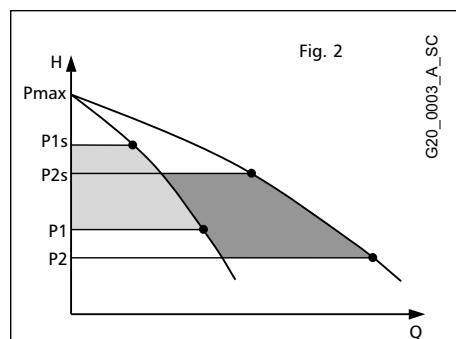

TWO-PUMP SETS WITH FIXED-SPEED MOTORS AND PRESSURE SWITCH CONTROL

The starting and stopping of the pumps are determinated by the pressure values set on the pressure switches. Each pressure switch is connected to a single pump with a cyclic pump changeover. The differential pressure is the difference between starting pressure and switch-off pressure. It is set at the same value for both pumps.

Figure 2 shows the operating mode with the pumps' curves.

- On demand, water is drawn from the tank.
- When the pressure drops to the $P1_s$ value the first pump starts.
- If the water consumption increases and the pressure drops to the $P2_s$ value, the second pump starts.
- When consumption reduces and the pressure increases until it reaches the $P1_s$ value, one of the pumps is switched off.
- If consumption keeps reducing, the pump changes the tank and stops at the $P1_s$ value.

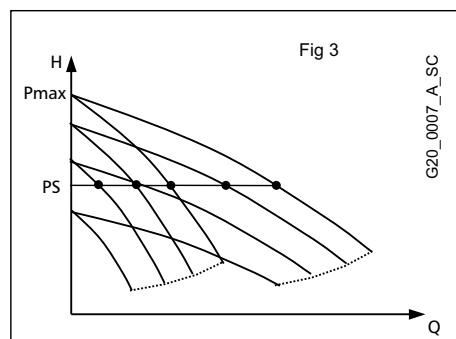

TWO-PUMP SETS WITH VARIABLE-SPEED MOTORS AND PRESSURE TRANSDUCER CONTROL

The starting and stopping of the pumps are determined by the pressure values set on the controller. Each frequency converter is connected to a pressure transducer. The converters exchange information with each other and provide for cyclic changeover.

Figure 3 shows the operating mode with the pumps' curves.

- On demand, water is drawn from the tank.
- When the pressure drops below the PS setting the first pump starts and the speed is adjusted to maintain a constant pressure as the demand increases.
- If the water consumption increases and the pump reaches maximum speed, the second pump starts and the speed is adjusted to maintain a constant pressure.
- When consumption reduces the speed is reduced until minimum speed is reached and one of the pumps is switched off.
- If consumption keeps reducing the pump slows down, charges the tank and stops at the PS setting.

DESCRIPTION OF OPERATION

SPHERE UNIT ONE PUMP SET

The **SPHERE UNIT** is a small boost unit, fixed speed, with one pump, automatic operation, assembled with pressure switch, pressure gauge, junction, membrane tank 24 litres included. According to decrease or increase of the valve pressure, pressure switch defines the start and stop of the pump.

BOOSTER SET TWO PUMPS

Fixed speed booster sets **GXS, GMD** series, control and protection panel, with electronic board, manages the operation of the pumps, the cyclic changeover, and in case of lack of water, stops the set. The pumps run in cascade through the pressure switches signal.

Variable speed booster sets **GTKS, GHV** series each pump is driven by Teknospeed inverter (**GTKS**) or Hydrovar (**GHV**). Pumps run in cascade through the pressure transducer signal.

Cyclical exchange of pumps

Cyclical exchange of pumps is available for all series (**GXS, GMD, GTKS, GHV**). For the **GHV** series the pumps are equipped each with its own drive alternate the start at every system restart or at a given time set for each pump by means of an internal clock in the drive menu.

In the **GXS** and **GMD** series, the cyclical exchange of pumps is controlled by electrical panel.

Protection against dry running

The protection function against dry running intervenes if the water reserve to which the booster set is connected falls below the minimum level guaranteed for suction.

The level may be controlled by a float, level probes or minimum pressure switch.

Membrane Tank

Frequent demand or **small system losses** determine pressure variations that may be compensated for by using a **tank**. Correct selection of a diaphragm tank **reduces the number of pump starts** and, if it is installed near the booster set, helps reduce the effect of water hammer.

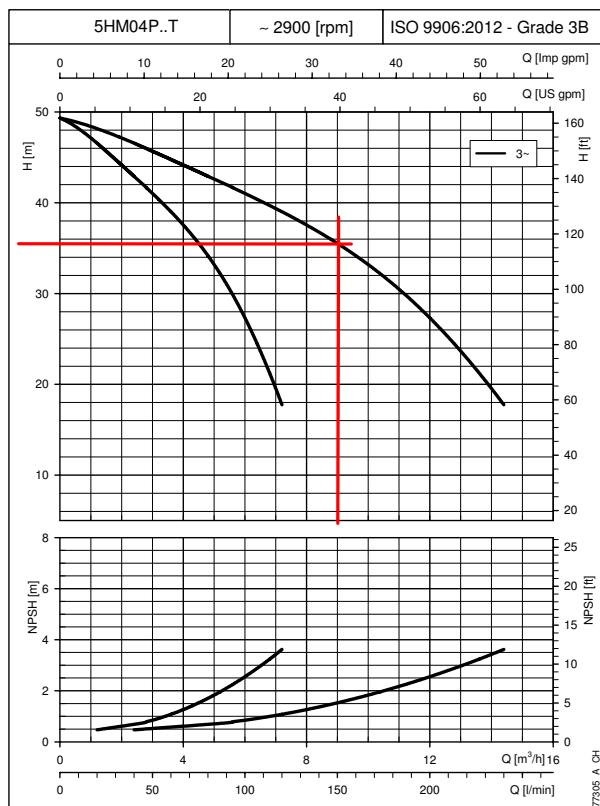

The booster sets are **ready** for installation with diaphragm tanks mounted directly on the delivery manifold, and additional tanks can be connected to the unused end of the manifold.

A **simplified calculation method**, developed from experience, is provided in the Appendix. It supplies useful flow rate and head values for most common requirements, as well as a method for calculating diaphragm tank size.

Variable speed booster sets need **smaller tanks** compared to traditional systems. Generally speaking, a tank with a liter capacity of just 10% of the nominal capacity of a single pump, expressed in liters per minute, is needed.

TWO-PUMP BOOSTER SETS SELECTING THE PUMPS

The choice of pump is therefore based on the characteristic curve of the pump depending on the flow rate and the pressure required for the system. Starting from the required flow rate, a vertical line is drawn until it meets the horizontal line of the required pressure. The point of intersection of the lines gives both the type and the number of pumps necessary for the system.

The example alongside refers to a required flow rate of 9 m³/h and a pressure of 36 water column.

As may be seen from the selection, the system requires two pumps of the type 5HM04P..T as indicated on the left chart.

Moreover the take-off point falls in the npsh area farthest to the left and therefore in an area with a low cavitation risk.

The values obtained are those for the performance of the pumps. A correct check of the net pressure value must be made due to the intrinsic load loss of the booster set and the conditions of installation.

BOOSTER SETS

SELECTING THE PUMPS

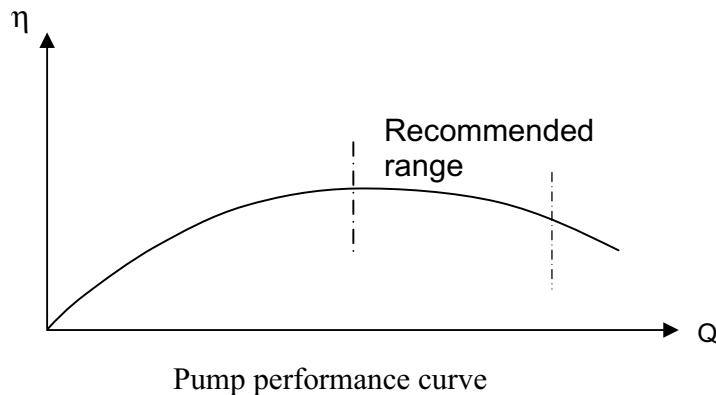

What type of pump to choose?

Generally, the choice of pump is based on the take-off point of the system, which is usually the highest possible. As maximum demand normally lasts a short time, the pump must also be able to satisfy variable requests throughout its time in service.

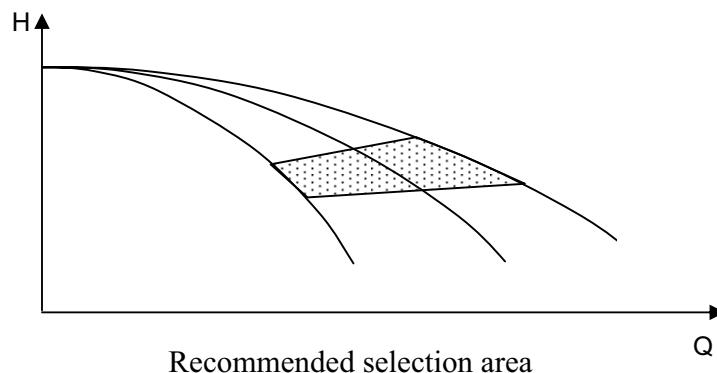

In this case, if variability is elevated, variable speed booster sets are preferred (**GTKS, GHV**).

Generally the choice of the pump, based on the performance curve, should fall around the maximum efficiency point. The pump must ensure operation within its rated performance.

Since the booster set is sized according to the maximum possible consumption, the take-off point of the pumps must be in the area on the right of the performance curve so that, if there is a fall in consumption, the efficiency remains high.

If we make a choice on the characteristic curve of the pump, we can see that the area where it is best to select the pump is represented by the following graph:

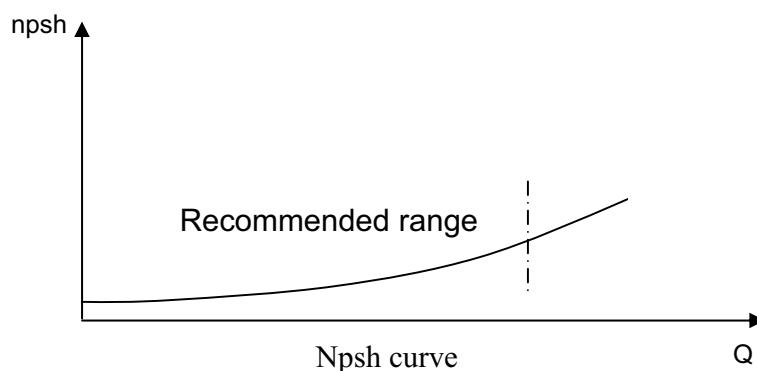

Another factor to be considered when choosing the pumps is its npsh value. Never choose a pump where the take-off point is too far to the right of the npsh curve.

This risks not having good pump suction, which may be aggravated by the type of installation (where negative suction is possible).

In these cases there is the risk of cavitation.

The npsh of the pump must always be checked at the maximum flow rate requested.

BOOSTER SETS

CHARACTERISTICS OF THE ELECTRIC PUMPS

The **BG**, **BGM** series comprises self-priming, single-impeller, horizontal centrifuge pumps featuring stainless steel bodies and rotors.

Motor: enbloc motor-pump coupling with rotor directly splined onto the motor shaft protrusion.

Technical Information (standard version):

Flow rates: up to 4,2 m³/h.
Head: up to 53 m.

Temperature of pumped liquid:
from -10°C to +40°C.

Maximum ambient temperature: +40°C.

Maximum suction head: 8 m.

Mechanical seal: Ceramic/Carbon/EPDM (standard).

Elastomers: EPDM.

Motor

Standard supplied IE2/IE3 three-phase surface motors ≥ 0,75 kW are compliant with Regulation (EC) no. 640/2009 and IEC 60034-30.

Electrical performances according to EN 60034-1.

Insulation class 155 (F).

IP55 protection.

Condensate drain plugs on standard version.

Cooling by fan according to EN 60034-6.

Cable gland metric size according to EN 50262.

Standard voltage:

• **Single-phase version:**

220-240 V 50 Hz (incorporated automatic-reset overload protection up to 1,5 kW).

• **Three-phase version:**

220-240/380-415 V 50 Hz for power up to 3 kW (incorporated automatic-reset overload protection included into booster set control panel).

For electrical data of the motors used see Technical Appendix.

BOOSTER SETS

CHARACTERISTICS OF THE ELECTRIC PUMPS

The **CEA, CEAM** series comprises centrifuge pumps with single impeller in pressed AISI 304 stainless steel. The enblock centrifuge pump features axial suction and radial discharge. Compact construction, with pump coupled directly to motor; special motor shaft extension in common with the pump and supported by ball bearings. The rotating part can be removed from the control side without removing the pump body from the system piping. Threaded suction and discharge ports (Rp ISO 7).

Technical Information (standard version):

Flow rates: up to 31 m³/h.
Head: up to 32 m.

Temperature of pumped liquid:
from -10°C to +85°C (standard version).

Special versions on request.

Maximum operating pressure: 8 bar.

Power: from 0,37 to 3 kW.

Mechanical seal: Ceramic/Carbon/NBR (standard).

Elastomers: NBR.

Motor

Standard supplied IE2/IE3 three-phase surface motors ≥ 0,75 kW are compliant with Regulation (EC) no. 640/2009 and IEC 60034-30.

Electrical performances according to EN 60034-1.

Insulation class 155 (F).

IP55 protection.

Condensate drain plugs on standard version.

Cooling by fan according to EN 60034-6.

Cable gland metric size according to EN 50262.

Standard voltage:

- **Single-phase version:**

220-240 V 50 Hz (incorporated automatic-reset overload protection up to 1,5 kW).

- **Three-phase version:**

220-240/380-415 V 50 Hz for power up to 3 kW (incorporated automatic-reset overload protection included into booster set control panel).

For electrical data of the motors used see Technical Appendix.

BOOSTER SETS**CHARACTERISTICS OF THE ELECTRIC PUMPS**

The **P** pump series, is an peripheral electric pump that is able to provide high head using low power motors.

**Technical Information** (standard version):

Flow rates: up to 3,72 m³/h.

Head: up to 82 m.

Temperature of pumped liquid:
from -10°C to +40°C.

Maximum ambient temperature: +40°C.

Materials:

Pump body: Cast iron.

Adapter: Cast iron.

Impeller: Brass.

Mechanical seal: Ceramic/Carbon/NBR (standard).

Elastomers: NBR.

Motor

Standard supplied IE2/IE3 three-phase surface motors ≥ 0,75 kW are compliant with Regulation (EC) no. 640/2009 and IEC 60034-30.

Electrical performances according to EN 60034-1.

Insulation class 155 (F).

IP55 protection.

Condensate drain plugs on standard version.

Cooling by fan according to EN 60034-6.

Cable gland metric size according to EN 50262.

Standard voltage:

• Single-phase version:

220-240 V 50 Hz (incorporated automatic-reset overload protection up to 1,5 kW).

• Three-phase version:

220-240/380-415 V 50 Hz for power up to 3 kW (overload protection to be provided by the user).

For electrical data of the motors used see Technical Appendix.

BOOSTER SETS**CHARACTERISTICS OF THE ELECTRIC PUMPS**

The **e-HM™** is a non-self-priming, end-suction horizontal multistage, high pressure centrifugal pump, with axial threaded inlet and radial threaded outlet. The pumps are close-coupled design and are equipped with non-standard Lowara motors. The **e-HM™** is equipped with mechanical seal.

**Technical Information** (standard version):

Flow rates: up to 29 m³/h.
Head: up to 159 m.

Temperature of pumped liquid:
from -10 to -30°C according to gasket material.
+90°C for three-phase version and uses according
to EN 60335-2-41.
+120°C for three-phase version with stainless steel impellers
(HM..S, HM..N) and uses other than EN 60335-2-41.
+60°C for single-phase version.

Maximum operating pressure:
10 bar (PN 10) for pumps with Noryl™ impeller.
16 bar (PN 16) for pumps with stainless steel impeller.

Power: from 0,5 to 4 kW.

Mechanical seal:
Ceramic / Carbon / EPDM (standard).
Silicon Carbide/Carbon/EPDM (PN16).

Elastomers: EPDM.

Motor**Standard three-phase surface motors ≥ 0,75 kW supplied as IE3.**

Electrical performances according to EN 60034-1.

Insulation class 155 (F).

IP55 protection.

Condensate drain plugs on standard version.

Cooling by fan according to EN 60034-6.

Cable gland metric size according to EN 50262.

Standard voltage:

• Single-phase version:

220-240 V 50 Hz (automatic overload protection included up to 2,2 kW).

• Three-phase version:

220-240/380-415 V 50 Hz for powers up to 3 kW.

380-415/660-690 V 50 Hz for powers above 3 kW.

(automatic overload protection included in the control panel).

For electrical data of the motors used see Technical Appendix.

Materials:

All pumps are certified for drinking water use (**WRAS** and **ACS**).

BOOSTER SETS

CHARACTERISTICS OF THE ELECTRIC PUMPS

The **VM** is a non-self-priming vertical multistage, high pressure centrifugal pump, with threaded inlet and outlet manifolds. The pumps are close-coupled design and are equipped with non-standard Lowara motors.

Technical Information (standard version):

Flow rates: up to 14 m³/h.

Head: up to 98 m.

Temperature of pumped liquid:

+90°C for versions with three-phase motor uses as EN 60335-2-41.

+60°C for versions with single-phase motor.

Maximum operating pressure: 10 bar (PN 10).

Power: from 0,5 to 3 kW.

Mechanical seal:

Ceramic / Carbon / EPDM (standard).

Elastomers: EPDM.

Motor

Standard three-phase surface motors ≥ 0,75 kW supplied as IE3.

Electrical performances according to EN 60034-1.

Insulation class 155 (F).

IP55 protection.

Condensate drain plugs on standard version.

Cooling by fan according to EN 60034-6.

Cable gland metric size according to EN 50262.

Standard voltage:

- **Single-phase version:**

220-240 V 50 Hz (automatic overload protection included up to 2,2 kW).

- **Three-phase version:**

220-240/380-415 V 50 Hz for powers up to 3 kW.

(automatic overload protection included in the control panel).

For electrical data of the motors used see Technical Appendix.

Materials:

All pumps are certified for drinking water use (**WRAS** and **ACS**).

BOOSTER SETS

The range includes fixed speed and variable speed systems available in a variety of material configurations to suit the specific requirements of different applications.

SPHERE UNIT

- Single-phase power supply, fixed speed and pressure switch control. For P, BG, CEA, and HM-P series electric pumps.

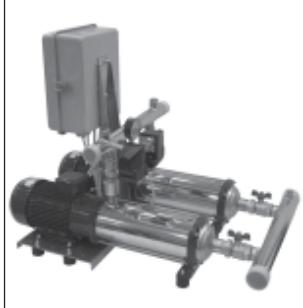

Head up to 77 m.
Flow rate up to 28,8 m³/h.
Power up to 1 x 1,5 kW.

GXS SERIES SETS

- Single-phase power supply, fixed speed and pressure switch control. For BG, CEA, HM, and VM series electric pumps.

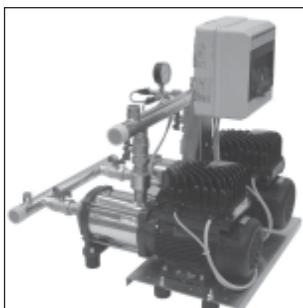

Head up to 140 m.
Flow rate up to 58 m³/h.
Power up to 2 x 1,5 kW.

GMD SERIES SETS

- Three-phase power supply, fixed speed and pressure switch control. For BG, CEA, HM, and VM series electric pumps.

Head up to 160 m.
Flow rate up to 62 m³/h.
Power up to 2 x 4 kW.

GTKS SERIES SETS

- Single-phase power supply, variable speed and control by pressure transducers and Teknospeed electronic speed controllers integrated with the motor. For BG, CEA, HM, and VM series electric pumps.

Head up to 95 m.
Flow rate up to 52 m³/h.
Power up to 2 x 1,1 kW.

GHV SERIES SETS

- Single-phase or three-phase power supply, variable speed and control by pressure transducers and Hydrovar electronic speed controllers mounted on the motor. For VM series electric pumps.

Head up to 100 m.
Flow rate up to 58 m³/h.
Power up to 2 x 3 kW.

REFERENCE STANDARDS

- The Lowara two-pump booster sets are CE-marked for conformity with the following directives:
 - Machinery Directive: 2006/42/EC.
 - Low Voltage Directive 2006/95/EC.
 - Electromagnetic Compatibility Directive 2004/108/EC
- Electric pump performance complies with the following standard:
ISO 9906;2012 - Grade 3B, Rotodynamic pumps – hydraulic performance acceptance tests.

sets****MARKET SECTORS**

RESIDENTIAL

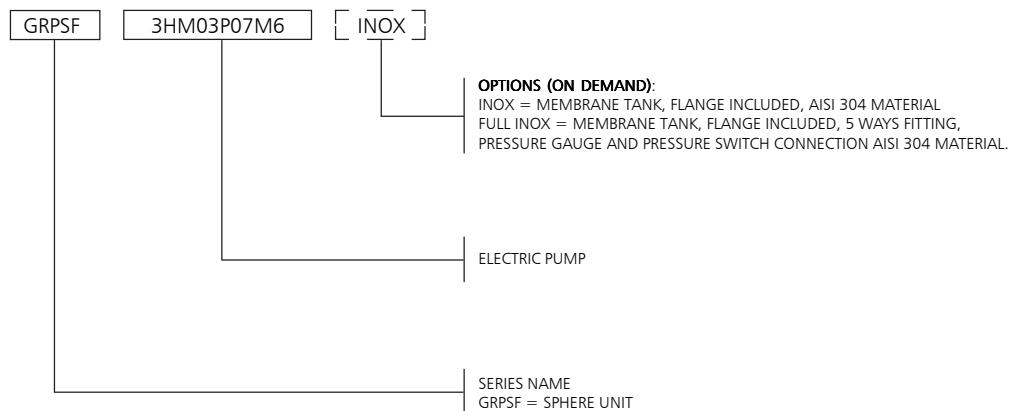

**SPHERE
UNIT****SPHERE UNIT
Series****SPECIFICATIONS**

- **Flow rate** up to 28,8 m³/h.
- **Head** up to 77 m.
- Electrical supply voltage:
1 x 230V ± 10%.
- Frequency: 50 Hz.
- Maximum electric pump power 1 x 1,5 kW.
- Direct motor start, by pressure switch.
- Maximum temperature of pumped liquid:
from -10 to +40°C (for BGM, PM).
from -10 to +60°C (for CEAM, HM).
- **Horizontal design pump:**
BGM, CEAM, P and HM..P series.
Maximum operating pressure 8 bar.

a xylem brand

SPHERE UNIT IDENTIFICATION CODE

OPERATING CHARACTERISTICS AND LIMITS

Liquids handled	Water containing no gas or corrosive and/or aggressive substances.
Fluid temperature(*)	BGM, PM: above -10°C to + 40 °C. CEAM, eHM: above -10°C to + 60 °C.
Ambient temperature (*)	CEAM, BGM, PM: above -15°C to + 40 °C. HM: da -15°C a +45°C (above -15°C to +40 °C for models 3HM03S, 3HM02P, 5HM02S and for all models with motor 0,95kW).
Maximum operating pressure	Max 8 bar depending on the type of pump.
Minimum inlet pressure	According to NPSH curve and losses, with a minimum margin of 0.5 m.
Maximum inlet pressure	The inlet pressure added to the pressure of the pump at zero flow must be lower than the maximum operating pressure of the set
Hourly starts (single pump)	Max 60 up to 3 kW depending on the type of pump.
Installation	Indoors, protected from the weather. Away from heat sources. Max elevation 1000 m ASL. Max humidity 50% without condensation.
Sound emission	Sound emission level Lp < 70 dB(A) for pump set with 2900 rpm motor with power up to 4 kW.

(*) Standard configuration

SPHERE
UNIT

**Booster
sets****MARKET SECTORS**

RESIDENTIAL

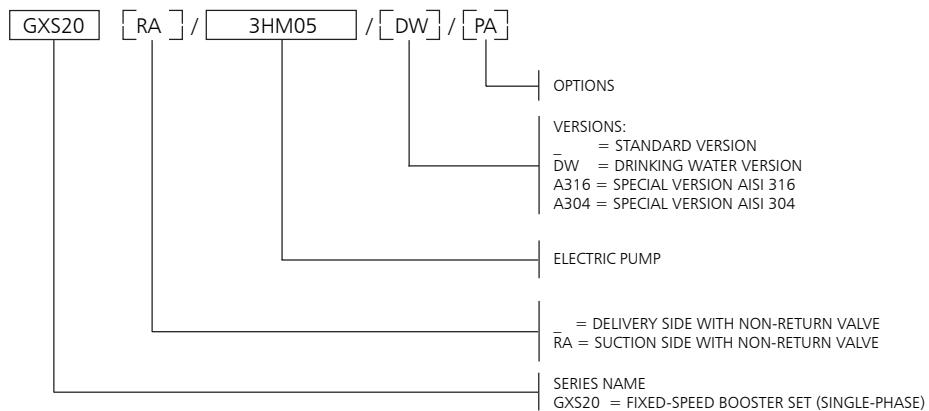

APPLICATIONS

- Water network supply in condominiums, single villa and townhouses.
- Water supply for irrigation systems.

**GXS20
Series****GXS20****SPECIFICATIONS**

- **Flow rate** up to 58 m³/h.
- **Head** up to 140 m.
- Electrical panel supply voltage: 1 x 230V ± 10%.
- Frequency: 50 Hz.
- Protection class electrical panel IP 55.
- Maximum electric pump power 2 x 1,5 kW.
- Direct motor start.
- Maximum temperature of pumped liquid:
from -10 to +40° C (for BGM).
from -10 to +60° C (for CEAM,
HM and VM series).
- **Horizontal design pump:**
BGM-CEAM and HM..P/S series.
Maximum operating pressure 16 bar.
- **Close-coupled threaded vertical multistage:**
VM series.
Maximum operating pressure 10 bar.

TWO-PUMP BOOSTER SETS, GXS20 SERIES IDENTIFICATION CODE

GXS20

OPTIONS (ON DEMAND)

- 3A Booster set with electric pump certified 1A (Factory test reports issued by the end of assembly line; it includes QH curve).
- 3B Booster set with electric pump certified 1B (Test report issued by Audit Test Lab; it includes QH curve, efficiency and power).
- 60 Booster set with 60Hz supply voltage.
- BAP High pressure switch installed on the delivery manifold.
- C9 Delivery manifold at 90° with bend. The tanks can not be installed directly on the manifold, only for e-SV™ and VM sets.
- CM Suction or delivery manifold larger than standard size.
- CP Dry contact version: power line, Automatic/Manual mode, Run/Stop for each pump, thermal block.
- PA Minimum pressure gauge installed on the suction manifold for dry-running protection.
- PMA Minimum pressure switch for dry-running protection and pressure gauge installed on suction manifold.
- PQ Booster set with higt suction pressure (pressure gauge/pressure switches increased of one range).
- RA Non return valves mounted on suction side (I.e: GXS20RA/5SV...).
- SA No intake: no suction valves and suction manifold.
- SC Group with no control devices, such as pressure switches and transmitters; the pressure gauge is present.
- SCA No suction manifold (suction valves present).
- SCM Without delivery manifold (no pressure transmitters and pressure gauge, with delivery valves).
- SM Without delivery: without valves on delivery and without delivery manifold.
- TS Booster set with pumps equipped with special mechanical seals.
- UK UK market version.
- WM Wall-mounted electrical panel with fixing tabs. Cables L= 5m

AVAILABLE VERSIONS

- A304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
- B304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior.
- C304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Baseplate, frame, supports, bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior. Valves and their components completely in Aisi 304 or superior (body, disc, plate).
- A316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
- B316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinkingwater. Pumps in Aisi 316 material. Bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316.
- C316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Baseplate, frame, supports, bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316. Valves and their components completely in Aisi 316 (body, disc, plate).
- DW Main component in contact with fluid suitable for drinking water or in stainless steel AISI 304 or superior quality.

TWO-PUMP BOOSTER SETS, GXS20 SERIES OPERATING CHARACTERISTICS AND LIMITS

Liquids handled	Water containing no gas or corrosive and/or aggressive substances.
Fluid temperature(*)	BGM: above -10°C to + 40 °C. CEAM, eHM, eVM: above -10°C to + 60 °C.
Ambient temperature (*)	CEAM, BGM: above -15°C to + 40 °C. VM: above -15°C to +45°C (above -15°C to +40 °C for models 3VM02P and for all models with motor 0,95kW). HM: da -15°C a +45°C (above -15°C to +40 °C for models 3HM03S, 3HM02P, 5HM02S and for all models with motor 0,95kW).
Maximum operating pressure	Max 8 bar, 10 bar, 16 bar Depending on the type of pump.
Minimum inlet pressure	According to NPSH curve and losses, with a minimum margin of 0.5 m.
Maximum inlet pressure	The inlet pressure added to the pressure of the pump at zero flow must be lower than the maximum operating pressure of the set
Hourly starts (single pump)	Max 60 up to 3 kW, above 3 kW and up to 4 kW max 40.
Installation	Indoors, protected from the weather. Away from heat sources. Max elevation 1000 m ASL. Max humidity 50% without condensation.
Sound emission	Sound emission level Lp < 70 dB(A) for two-pump set with 2900 rpm motor with power up to 2 x 4 kW.

(*) Standard configuration

gxs20_2p-en_b_tm

TWO-PUMP BOOSTER SETS, GXS20 SERIES MAIN COMPONENTS

- **Main On-off valves** on suction and discharge side of each pump, ball type with threaded coupling.
- **Check valve** on discharge side of each pump, spring-loaded type, with threaded coupling.
For applications with air-cushion surge tanks, they are mounted on the suction side and the set is equipped with a connector for G 1/2" threaded flexible air feeder pipe (GXS20RA.. series).
- **Suction manifold** made of galvanized or AISI 304 stainless steel with threaded ends.
Threaded coupling for water charging.
- **Delivery manifold** made of galvanized or AISI 304 stainless steel with threaded ends. Fitted with R1" threaded couplings with caps to allow connection of 24 or 20-litre diaphragm pressure vessels.
Only one connection R1" threaded for **VM** sets.
- **Pressure gauge and 2 control transmitters** located on the delivery side of the unit.
- **Various couplings** in nickel-plated brass, galvanised steel or stainless steel depending on the version.
- **Mounting base**, for pumpset and panel mounting brackets in galvanised steel.
- **Electric control panel**, IP55 protection class.

STANDARD VERSIONS AVAILABLE

See table of materials.

STANDARD VERSION For general applications

Valves in brass or nickel plated brass, galvanized steel or brass fittings.

DW VERSION (GXS20../DW)

For drinking water applications.

The main components in contact with the liquid are certified suitable for drinking water or are made of AISI 304 or higher grade of stainless steel.

AISI304 Version (GXS20../A304), AISI 316 (GXS20../A316)

For special applications

Manifolds, valves, non-return valves and main components with parts directly in contact with the pumped liquid are made of AISI 304 or AISI 316 stainless steel.

Accessories available on request:

- Devices **against dry running** in one of the following versions:
 - float switch, for positive suction head;
 - probe electrodes kit, for positive suction head;
 - minimum pressure switch, for positive suction head.
- **Surge tank** in the following versions:
 - Air-cushion surge tank with compressor and accessories for surge tank and compressor.
 - Diaphragm vessel as an alternative to the air-cushion tank.
- **Kit featuring** 24 or 20-litres **diaphragm expansion vessel** with 1" ball valve, in the following versions, depending on the maximum head of the pumps:
 - 24-litre 8 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit, Aisi 304
 - 24-litre 10 bar cylinder water vessel kit
 - 20-litre 25 bar cylinder water vessel kit
- **Alarm kit**;
- **Air feeder** for **RA** version.

SPECIAL VERSIONS AVAILABLE ON REQUEST

(Contact the Sales and technical Assistance Service)

- Support base in AISI 304, AISI 316 stainless steel.
- Units with stainless steel expansion vessels.
- Units with special valves.
- Sets with jockey pump.

TWO-PUMP BOOSTER SETS, GXS20 SERIES CONTROL PANEL

Electrical panel (fig. 1), single-phase power input, for controlling and protecting up to two single-phase electric pumps, made from polycarbonate and protected to IP55.

Main characteristics:

- Automatic switch with general overload protection.
- Standard supply voltage: 1x230Vac +/-10%, 50/60Hz.
- Lowara SX20 digital control unit (fig 2), with microprocessors, offers the following functions:
 - Indicator LED's: power on (ref. 1), general fault and no water level alarm (ref. 2), pump running (ref. 3).
 - Automatic, manual or disabled mode switches for each pump (ref. 4).
 - Automatic cascade control of electric pumps via two pressure switches.
 - Cycle reversal function (can be disabled). Automatically switches pumps after every start/stop cycle.
 - No-water protection system alternatives: float, minimum pressure switch, external contact or electrode probes with sensitivity adjustment.
 - Adjustable timer delaying tripping the no-water protection system (inside board).
 - Adjustable timer extending the operation of each pump (inside board).
 - A relay board (optional) can be connected to boost the following signals: pump 1,2 running, aut-man mode, overload alarm, no-water alarm, power on.
- External enable connection or pressure switch for maximum pressure protection.

GXS20

Booster sets

MARKET SECTORS

RESIDENTIAL

APPLICATIONS

- Water network supply in condominiums, single villa and townhouses.
- Water supply for irrigation systems.

GMD20 Series

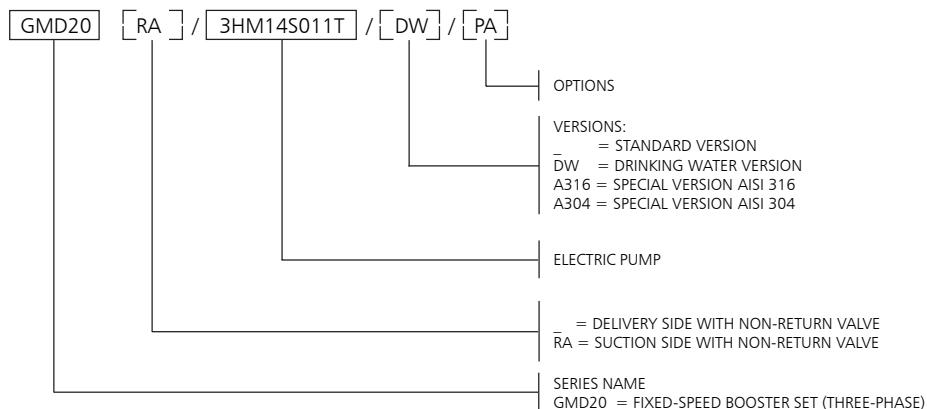

GMD20

SPECIFICATIONS

- **Flow rate** up to 62 m³/h.
- **Head** up to 160 m.
- Electrical panel supply voltage: 3 x 400V ± 10%.
- Frequency: 50 Hz.
- Protection class electrical panel IP 54.
- Maximum electric pump power 2 x 4 kW.
- Direct motor start.
- Maximum temperature of pumped liquid:
from -10 to +40° C (for BG).
from -10 to +60° C (for CEA,
HM and VM series).
- **Horizontal design pump:**
BG, CEA and HM..P/S series.
Maximum operating pressure 16 bar.
- **Close-coupled threaded vertical multistage:**
VM series.
Maximum operating pressure 10 bar.

TWO-PUMP BOOSTER SETS, GMD20 SERIES IDENTIFICATION CODE

OPTIONS (ON DEMAND)

- 230 Power supply of control panel 3 x 230V. For different voltage supply, see control panel section.
 3A Booster set with electric pump certified 1A (Factory test reports issued by the end of assembly line; it includes QH curve).
 3B Booster set with electric pump certified 1B (Test report issued by Audit Test Lab; it includes QH curve, efficiency and power).
 60 Booster set with 60Hz supply voltage.
 BAP High pressure switch installed on the delivery manifold.
 C9 Delivery manifold at 90° with bend. The tanks can not be installed directly on the manifold, only for e-SV™ and VM sets.
 CM Suction or delivery manifold larger than standard size.
 CP Dry contact version: power line, Automatic/Manual mode, Run/Stop for each pump, thermal block.
 IP55 Control panel IP55.
 IP65 IP65 version control panel.
 KV Kit voltmeter.
 ORG With Real time clock inside the panel.
 PA Minimum pressure gauge installed on the suction manifold for dry-running protection.
 PMA Minimum pressure switch for dry-running protection and pressure gauge installed on suction manifold.
 PQ Booster set with higt suction pressure (pressure gauge/pressure switches/pressure transmitter increased of one range).
 RA Non return valves mounted on suction side (I.e GMD20RA/SV...).
 RE Heaters inside the control panel, with thermostat.
 RV Electric panel with phase sequence, phase loss, over- and undervoltage and phase unbalance.
 SA No intake: no suction valves and suction manifold.
 SC Group with no control devices, such as pressure switches and transmitters; the pressure gauge is present.
 SCA No suction manifold (suction valves present).
 SCM Without delivery manifold (no pressure transmitters and pressure gauge, with delivery valves).
 SM Without delivery: without valves on delivery and without delivery manifold.
 TS Booster set with pumps equipped with special mechanical seals.
 UK UK market version.
 VA Electric control panel fitted with analogue voltmeter and ammeter.
 WM Wall-mounted electrical panel with fixing tabs. Cables L= 5m

AVAILABLE VERSIONS

- A304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
 B304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior.
 C304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Baseplate, frame, supports, bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior. Valves and their components completely in Aisi 304 or superior (body, disc, plate).
 A316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
 B316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinkingwater. Pumps in Aisi 316 material. Bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316.
 C316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Baseplate, frame, supports, bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316. Valves and their components completely in Aisi 316 (body, disc, plate).
 DW Main component in contact with fluid suitable for drinking water or in stainless steel AISI 304 or superior quality.

a xylem brand

TWO-PUMP BOOSTER SETS, GMD20 SERIES OPERATING CHARACTERISTICS AND LIMITS

Liquids handled	Water containing no gas or corrosive and/or aggressive substances.
Fluid temperature (*)	BG: above -10°C to + 40 °C. CEA, eHM, eVM: above -10°C to + 60 °C.
Ambient temperature (*)	CEA, BG: above -15°C to + 40 °C. HM, VM: above -15°C to +50°C
Maximum operating pressure	Max 8 bar, 10 bar, 16 bar Depending on the type of pump.
Minimum inlet pressure	According to NPSH curve and losses, with a minimum margin of 0.5 m.
Maximum inlet pressure	The inlet pressure added to the pressure of the pump at zero flow must be lower than the maximum operating pressure of the set
Hourly starts (single pump)	Max 60 up to 3 kW, above 3 kW and up to 4 kW max 40.
Installation	Indoors, protected from the weather. Away from heat sources. Max elevation 1000 m ASL. Max humidity 50% without condensation.
Sound emission	Sound emission level Lp < 70 dB(A) for two-pump set with 2900 rpm motor with power up to 2 x 4 kW.

(*) standard configuration

Base	Galvanized steel	Galvanized steel	Galvanized steel	Galvanized steel
Pump Body	- AISI 304 - Cast iron for VM pump	- AISI 304 - Cast iron for VM pump	- AISI 304 - Cast iron for VM pump	- AISI 316(*) - Cast iron for VM pump

* Not all models of electric pumps are available in AISI 316. Consult technical catalog of pump.

gmd20_2p-en_b_tm

GMD20

TWO-PUMP BOOSTER SETS, GMD20 SERIES MAIN COMPONENTS

- **Main On-off valves** on suction and discharge side of each pump, ball type with threaded coupling.
- **Check valve** on discharge side of each pump, spring-loaded type, with threaded coupling.
For applications with air-cushion surge tanks, they are mounted on the suction side and the set is equipped with a connector for G 1/2" threaded flexible air feeder pipe (GMD20RA.. series).
- **Suction manifold** made of galvanized or AISI 304 stainless steel with threaded ends.
Threaded coupling for water charging.
- **Delivery manifold** made of galvanized or AISI 304 stainless steel with threaded ends. Fitted with R1" threaded couplings with caps to allow connection of 24 or 20-litre diaphragm pressure vessels.
Only one connection R1" threaded for **VM** sets.
- **Pressure gauge and 2 control transmitters** located on the delivery side of the unit.
- **Various couplings** in nickel-plated brass, galvanised steel or stainless steel depending on the version.
- **Mounting base**, for pumpset and panel mounting brackets in galvanised steel.
- **Electric control panel**, IP54 protection class.

STANDARD VERSIONS AVAILABLE

See table of materials.

STANDARD VERSION For general applications

Valves in brass or nickel plated brass, galvanized steel or brass fittings.

DW VERSION (GMD20../DW)

For drinking water applications.

The main components in contact with the liquid are certified suitable for drinking water or are made of AISI 304 or higher grade of stainless steel.

AISI304 Version (GMD20../A304),

AISI 316 (GMD20../A316)

For special applications

Manifolds, valves, non-return valves and main components with parts directly in contact with the pumped liquid are made of AISI 304 or AISI 316 stainless steel.

Accessories available on request:

- Devices **against dry running** in one of the following versions:
 - float switch, for positive suction head;
 - probe electrodes kit, for positive suction head;
 - minimum pressure switch, for positive suction head.
- **Surge tank** in the following versions:
 - Air-cushion surge tank with compressor and accessories for surge tank and compressor.
 - Diaphragm vessel as an alternative to the air-cushion tank.
- **Kit featuring** 24 or 20-litres **diaphragm expansion vessel** with 1" ball valve, in the following versions, depending on the maximum head of the pumps:
 - 24-litre 8 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit, Aisi 304
 - 24-litre 10 bar cylinder water vessel kit
 - 20-litre 25 bar cylinder water vessel kit
- **Alarm kit**;
- **Air feeder** for **RA** version.

SPECIAL VERSIONS AVAILABLE ON REQUEST

(Contact the Sales and technical Assistance Service)

- Support base in AISI 304, AISI 316 stainless steel.
- Units with stainless steel expansion vessels.
- Units with special valves.
- Sets with jockey pump.
- Booster sets with NO-standard voltage supply, for instance: 3 x 440 V.

TWO-PUMP BOOSTER SETS, GMD20 SERIES CONTROL PANEL

Electric panel, three-phase power supply, for controlling and protecting up to two three-phase electric pumps, with case made from sheet steel (fig. 1) and protected to IP54.

Main characteristics:

- Main door-lock switch, fuse holders and fuses, starting contactors and thermal protection such as overload protectors for each motor.
- Standard supply voltage: 3x400Vac +/-10%, 50/60Hz. Non standard voltages on request, 3x230Vac +/-10%, 3x440Vac +/-10%, 3x460Vac +/-10%, 3x480Vac +/-10%, 50/60Hz.
- Transformer for low voltage auxiliary circuit; auxiliary voltage 24 Vac.
- Lowara SM20 digital control unit (see fig. 2), offers the following functions:
 - Indicator LED's: power on (ref. 1), thermal protection cut-in (ref. 2), no-water level alarm (ref. 3), pump running (ref. 4).
 - Automatic / manual operation buttons (ref. 5) and indicator LED's (ref. 6).
 - Manual pump stop/start (one button for each pump) (ref. 7).
 - Automatic cascade pump control with two pressure switches (one for each pump).
 - Jockey pump management by disabling cycle reversal.
 - Cycle reversal function (can be disabled). Automatically switches pumps after every start/stop cycle.
 - Automatic, manual or disabled mode switches for each pump (inside board). Only to be used if a board fault develops in order to assure pump operation.
 - No-water protection system alternatives: float, minimum pressure switch, external contact or electrode probes with sensitivity adjustment.
 - Adjustable timer delaying tripping of the no-water protection system (inside board); can be adjusted from 0 to 30 seconds.
 - Adjustable timer extending the operation of each pump (inside board); can be adjusted from 0 to 100 sec.
 - A relay board (optional) can be installed on the board to boost the following signals: pump 1,2 running, manual mode, overload alarm, no-water alarm, power on.
- External enable connection or pressure switch for maximum pressure protection.

gmd20ra_vm-en_a_td

Booster sets

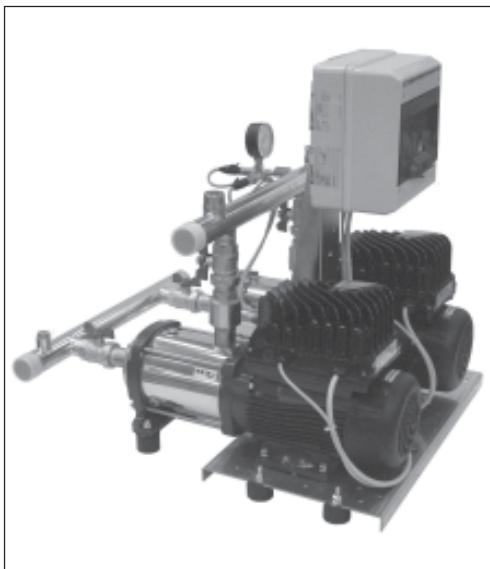

MARKET SECTORS

RESIDENTIAL

APPLICATIONS

- Water network supply in condominiums, single villa and townhouses.
- Water supply for irrigation systems.

GTKS20 Series

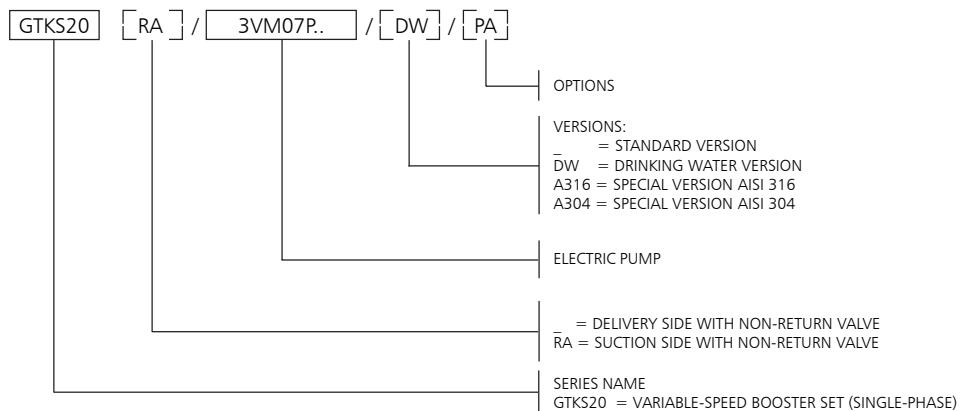

GTKS20

SPECIFICATIONS

- **Flow rate** up to 52 m³/h.
- **Head** up to 95 m.
- Electrical panel supply voltage: 1 x 230V ± 10%.
- Frequency: 50 Hz.
- Protection class electrical panel IP 55.
- Protection class converter IP 55.
- Maximum electric pump power 2 x 1,1 kW.
- **Motor start** with **TKS** converter.
- Maximum temperature of pumped liquid:
from -10 to +40° C (for BG).
from -10 to +60° C (for CEA,
HM and VM series).
- **Horizontal design pump**:
BG, CEA and HM..P/S series.
Maximum operating pressure 10 bar.
- **Close-coupled threaded vertical multistage**:
VM series.
Maximum operating pressure 10 bar.

TWO-PUMP BOOSTER SETS, GTKS20 SERIES IDENTIFICATION CODE

OPTIONS (ON DEMAND)

- 3A Booster set with electric pump certified 1A (Factory test reports issued by the end of assembly line; it includes QH curve).
 3B Booster set with electric pump certified 1B (Test report issued by Audit Test Lab; it includes QH curve, efficiency and power).
 60 Booster set with 60Hz supply voltage.
 BAP High pressure switch installed on the delivery manifold.
 C9 Delivery manifold at 90° with bend. The tanks can not be installed directly on the manifold, only for e-SV™ and VM sets.
 CM Suction or delivery manifold larger than standard size.
 CP Dry contact version: power line, Automatic/Manual mode, Run/Stop for each pump, thermal block
 IP65 IP65 version control panel.
 PA Minimum pressure gauge installed on the suction manifold for dry-running protection.
 PMA Minimum pressure switch for dry-running protection and pressure gauge installed on suction manifold.
 PQ Booster set with higt suction pressure (pressure gauge/pressure switches increased of one range).
 RA Non return valves mounted on suction side (I.e: GTSK20RA/3SV...).
 RE Heaters inside the control panel, with thermostat.
 SA No intake: no suction valves and suction manifold.
 SC Group with no control devices, such as pressure switches and transmitters; the pressure gauge is present.
 SCA No suction manifold (suction valves present).
 SCM Without delivery manifold (no pressure transmitters and pressure gauge, with delivery valves).
 SM Without delivery: without valves on delivery and without delivery manifold.
 TS Booster set with pumps equipped with special mechanical seals.
 UK UK market version.
 WM Wall-mounted electrical panel with fixing tabs. Cables L= 5m

AVAILABLE VERSIONS

- A304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
 B304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior.
 C304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Baseplate, frame, supports, bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior. Valves and their components completely in Aisi 304 or superior (body, disc, plate).
 A316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
 B316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinkingwater. Pumps in Aisi 316 material. Bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316.
 C316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Baseplate, frame, supports, bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316. Valves and their components completely in Aisi 316 (body, disc, plate).
 DW Main component in contact with fluid suitable for drinking water or in stainless steel AISI 304 or superior quality.

TWO-PUMP BOOSTER SETS, GTKS20 SERIES OPERATING CHARACTERISTICS AND LIMITS

Liquids handled	Water containing no gas or corrosive and/or aggressive substances.
Fluid temperature (*)	BG: above -10°C to + 40 °C. CEA, eHM, eVM: above -10°C to + 60 °C.
Ambient temperature (*)	CEA, BG, HM, VM: above 0°C to + 40 °C.
Maximum operating pressure	Max 8 bar, 10 bar, 16 bar Depending on the type of pump.
Minimum inlet pressure	According to NPSH curve and losses, with a minimum margin of 0.5 m.
Maximum inlet pressure	The inlet pressure added to the pressure of the pump at zero flow must be lower than the maximum operating pressure of the set
Hourly starts (single pump)	Max 60 up to 3 kW, above 3 kW and up to 4 kW max 40.
Installation	Indoors, protected from the weather. Away from heat sources. Max elevation 1000 m ASL. Max humidity 50% without condensation.
Sound emission	Sound emission level Lp < 70 dB(A) for two-pump set with 2900 rpm motor with power up to 2 x 4 kW.

(*) in standard configuration

Pressure switches	Chrome plated zinc alloy	AISI 304	AISI 304	AISI 304
Pressure transmitter	AISI 316	AISI 316	AISI 316	AISI 316
Caps/plugs/flanges	Galvanized steel	AISI 304	AISI 304	AISI 316
Bracket	Galvanized steel	Galvanized steel	Galvanized steel	Galvanized steel
Base	Galvanized steel	Galvanized steel	Galvanized steel	Galvanized steel
Pump Body	- AISI 304 - Cast iron for VM pump	- AISI 304 - Cast iron for VM pump	- AISI 304 - Cast iron for VM pump	- AISI 316(*) - Cast iron for VM pump

* Not all models of electric pumps are available in AISI 316. Consult technical catalog of pump.

gtks20_2p-en_b_tm

TWO-PUMP BOOSTER SETS, GTKS20 SERIES MAIN COMPONENTS

- **Main On-off valves** on suction and discharge side of each pump, ball type with threaded coupling.
- **Check valve** on discharge side of each pump, spring-loaded type, with threaded coupling.
For applications with air-cushion surge tanks, they are mounted on the suction side and the set is equipped with a connector for G 1/2" threaded flexible air feeder pipe (GCKS20RA.. series).
- **Suction manifold** made of galvanized or AISI 304 stainless steel with threaded ends.
Threaded coupling for water charging.
- **Delivery manifold** made of galvanized or AISI 304 stainless steel with threaded ends. Fitted with R1" threaded couplings with caps to allow connection of 24 or 20-litre diaphragm pressure vessels.
Only one connection R1" threaded for **VM** sets.
- **Pressure gauge and 2 control transmitters** located on the delivery side of the unit.
- **Various couplings** in nickel-plated brass, galvanised steel or stainless steel depending on the version.
- **Mounting base**, for pumpset and panel mounting brackets in galvanised steel.
- **Electric control panel**, IP55 protection class.

STANDARD VERSIONS AVAILABLE

See table of materials.

STANDARD VERSION For general applications

Valves in brass or nickel plated brass, galvanized steel or brass fittings.

DW VERSION (GCKS20../DW)

For drinking water applications.

The main components in contact with the liquid are certified suitable for drinking water or are made of AISI 304 or higher grade of stainless steel.

AISI304 Version (GCKS20../A304), AISI 316 (GCKS20../A316)

For special applications

Manifolds, valves, non-return valves and main components with parts directly in contact with the pumped liquid are made of AISI 304 or AISI 316 stainless steel.

Accessories available on request:

- Devices **against dry running** in one of the following versions:
 - float switch, for positive suction head;
 - probe electrodes kit, for positive suction head;
 - minimum pressure switch, for positive suction head.
- **Surge tank** in the following versions:
 - Air-cushion surge tank with compressor and accessories for surge tank and compressor.
 - Diaphragm vessel as an alternative to the air-cushion tank.
- **Kit featuring** 24 or 20-litres **diaphragm expansion vessel** with 1" ball valve, in the following versions, depending on the maximum head of the pumps:
 - 24-litre 8 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit, Aisi 304
 - 24-litre 10 bar cylinder water vessel kit
 - 20-litre 25 bar cylinder water vessel kit
- **Alarm kit**;
- **Air feeder** for **RA** version.

SPECIAL VERSIONS AVAILABLE ON REQUEST

(Contact the Sales and technical Assistance Service)

- Support base in AISI 304, AISI 316 stainless steel.
- Units with stainless steel expansion vessels.
- Units with special valves.

TWO-PUMP BOOSTER SETS, GTKS20 SERIES CONTROL PANEL

Single-phase electrical power supply panel for protecting up to two three-phase electric pumps (3x230Vac), with Teknospeed frequency converter, made from polycarbonate, featuring a transparent door and protected to IP55.

Main characteristics:

- Automatic switch with overload protection for each converter.
- Standard supply voltage: 1x230Vac +/-10%, 50/60Hz.
- No-water protection system device alternatives:
float switch, minimum pressure switch, external contact. By using one optional module, to insert inside the board, electrode probes with sensitivity adjustment can be installed.
- A special version with "clean" potential-free contacts for signalling faults in each converter is available in request.

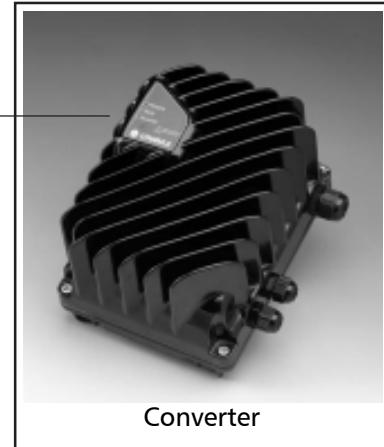

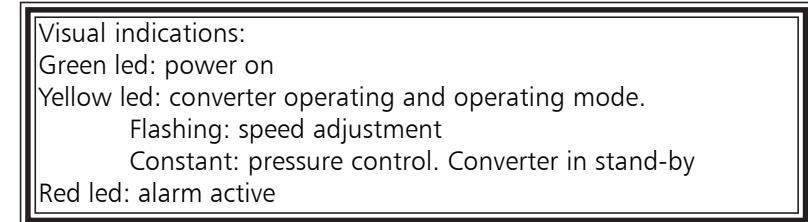

Electric panel

TEKNOSPEED FREQUENCY CONVERTER

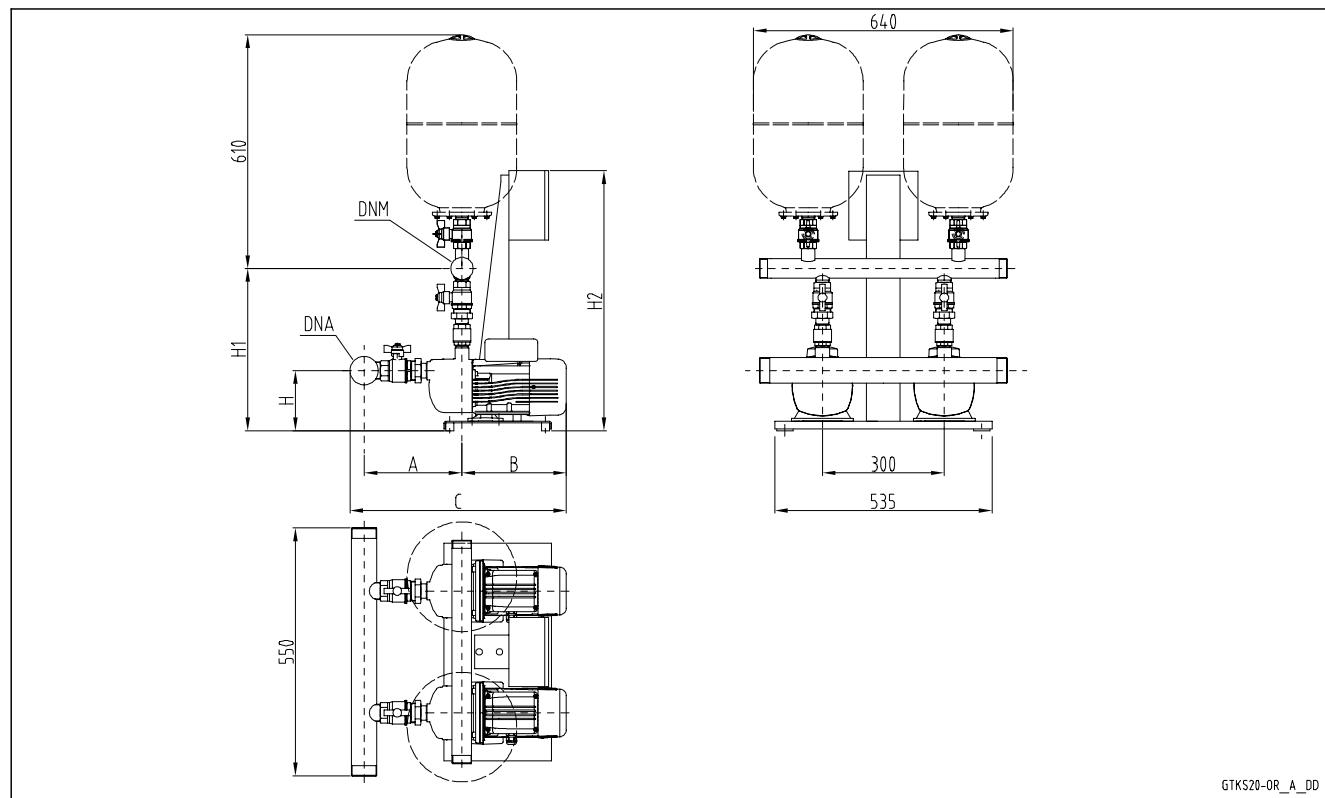

Each pump is controlled via the Teknospeed frequency converter which modulates the speed of rotation in order to keep system pressure constant. It is supplied complete with power-on, pump running and fault LED's, and a remote booster relay for converter overload, no-water, overheating alarms.

A float switch or an ON/OFF device protecting against dry running can also be installed. A serial line for transmitting information between the two units in order to assure cycle exchange, simultaneous operation in case of maximum demand and service continuity in case one pump is disabled.

**Booster
sets****MARKET SECTORS**

RESIDENTIAL

APPLICATIONS

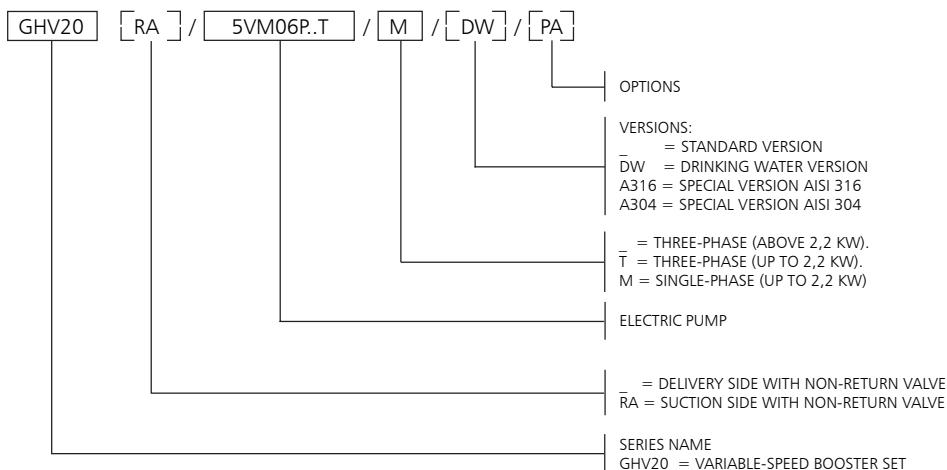

- Water network supply in condominiums, single villa and townhouses.
- Water supply for irrigation systems.

**GHV20
Series****SPECIFICATIONS**

- **Flow rate** up to 28 m³/h.
- **Head** up to 100 m.
- Electrical panel supply voltage: 1 x 230V ± 10% for power up to 2,2 kW.
- Electrical panel supply voltage: 3 x 400V ± 10% for power from 1,1 kW to 3 kW.
- Protection class electrical panel IP 55.
- Protection class converter IP 55.
- Maximum electric pump power 2 x 3 kW.
- Frequency: 50 Hz.
- **Motor start** with Hydrovar converter.
- Maximum temperature of pumped liquid: from -10 to +60° C.
- **Close-coupled threaded vertical multistage:** VM series. Maximum operating pressure 10 bar.

GHV20

TWO-PUMP BOOSTER SETS, GHV20 SERIES IDENTIFICATION CODE

OPTIONS (ON DEMAND)

- 2S Hydrovar® equipped with double sensor.
 3A Booster set with electric pump certified 1A (Factory test reports issued by the end of assembly line; it includes QH curve).
 3B Booster set with electric pump certified 1B (Test report issued by Audit Test Lab; it includes QH curve, efficiency and power).
 60 Booster set with 60Hz supply voltage.
 BAP High pressure switch installed on the delivery manifold.
 BF Hydrovar® equipped with "B" filter for three-phase supply; domestic environment.
 C9 Delivery manifold at 90° with bend. The expansion vessels cannot be installed directly on the manifold, only for e-SV™ and VM sets.
 CM Suction or delivery manifold larger than standard size.
 CP Clean contacts version: converter faulty, start/stop for each pump.
 HFD Hydrovar® and panel mounted delivery side (for wall mounted version Hydrovar®), available only up to 22kw power.
 HFS Hydrovar® and panel mounted suction side (for wall mounted version hydrovar).
 HWM Wall mounted hydrovar , cables lenght = 5 m.
 IP65 IP65 version control panel.
 KV Kit voltmeter.
 PA Minimum pressure switch installed on the suction manifold for dry-running protection.
 PMA Minimum pressure switch for dry-running protection and pressure gauge installed on suction manifold.
 PQ Booster set with higt suction pressure (pressure gauge/pressure switches/pressure transmitter increased of one range).
 RA Non return valves mounted on suction side (Es. GHV20RA/5VM...).
 RE Heaters inside the control panel, with thermostat.
 SA No intake: no suction valves and suction manifold.
 SC Group with no control devices, such as pressure switches and transmitters; the pressure gauge is present.
 SCA No suction manifold (suction valves present).
 SCM Without delivery manifold (no pressure transmitters and pressure gauge, with delivery valves).
 SM Without delivery: without valves on delivery and without delivery manifold.
 TS Booster set with pumps equipped with special mechanical seals.
 UK UK market version.
 VA Electric control panel fitted with analogue voltmeter and ammeter.
 WM Wall-mounted electrical panel with fixing tabs. Cables L= 5m

AVAILABLE VERSIONS

- A304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
 B304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior.
 C304 Main component in contact with liquid in stainless steel Aisi 304 or superior; gasket, sealing tape and thread sealing are suitable for drinking water. Baseplate, frame, supports, bolts and screws in Aisi 304 or superior. Flanges not in contact with the liquid in Aisi 304 or superior. Valves and their components completely in Aisi 304 or superior (body, disc, plate).
 A316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Bolts and screws galvanized. Flanges not in contact with the liquid in galvanized steel.
 B316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinkingwater. Pumps in Aisi 316 material. Bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316.
 C316 Main component in contact with liquid in stainless steel Aisi 316; gasket, sealing tape and thread sealing are suitable for drinking water. Pumps in Aisi 316 material. Baseplate, frame, supports, bolts and screws in Aisi 316. Flanges not in contact with the liquid in Aisi 316. Valves and their components completely in Aisi 316 (body, disc, plate).
 DW Main component in contact with fluid suitable for drinking water or in stainless steel AISI 304 or superior quality.

TWO-PUMP BOOSTER SETS, GHV20 SERIES OPERATING CHARACTERISTICS AND LIMITS

Liquids handled	Water containing no gas or corrosive and/or aggressive substances.
Fluid temperature (*)	above -10°C to + 60 °C.
Ambient temperature (*)	above 0 °C to +40 °C
Maximum operating pressure	Max 8 bar, 10 bar, 16 bar Depending on the type of pump.
Minimum inlet pressure	According to NPSH curve and losses, with a minimum margin of 0.5 m.
Maximum inlet pressure	The inlet pressure added to the pressure of the pump at zero flow must be lower than the maximum operating pressure of the set
Hourly starts (single pump)	Max 60 up to 3 kW
Installation	Indoors, protected from the weather. Away from heat sources. Max elevation 1000 m ASL. Max humidity 50% without condensation.
Sound emission	Sound emission level Lp < 70 dB(A) for two-pump set with 2900 rpm motor with power up to 2 x 3 kW.

(*) standard configuration

ghv20-VM_2p-en_a_ti

ghv20-VM_2p-en_a_tm

GHV20

TWO-PUMP BOOSTER SETS, GHV20 SERIES MAIN COMPONENTS

- **Main On-off valves** on suction and discharge side of each pump, ball type with threaded coupling up to 1"1/2 size included.
- **Check valve** on discharge side of each pump, spring-loaded type, with threaded coupling up to 1"1/2 size.
For applications with air-cushion surge tanks, they are mounted on the suction side and the set is equipped with a connector for G 1/2" threaded flexible air feeder pipe (serie GHV20RA..).
- **Suction manifold** made of AISI 304 stainless steel with threaded or flanged ends depending on the type of pump (see drawings). Threaded coupling for water charging.
- **Delivery manifold** made of AISI 304 stainless steel depending on the version, with threaded or flanged ends depending on the type of pump (see drawings). Fitted with R1" threaded coupling with cap to allow connection of 24 or 20-litre diaphragm pressure vessels.
- **Pressure gauge and 2 control transmitters** located on the delivery side of the unit.
- **Various couplings** in nickel-plated brass, galvanised steel or stainless steel depending on the version.
- **Mounting base**, for pumpset and panel mounting brackets in galvanised steel.
- **Electric control panel**, IP55 protection class.

STANDARD VERSIONS AVAILABLE

See table of materials.

STANDARD VERSION For general applications

Sets with 3-5-10 VM pumps:

Nickel-plated brass valves, non return valves with brass or technical plastic discs.

DW VERSION (GHV20../DW)

For drinking water applications.

The main components in contact with the liquid are certified suitable for drinking water or are made of AISI 304 or higher grade of stainless steel.
Nickel-plated brass valves, non return valves with brass or technical plastic discs.

AISI304 Version (GHV20../A304),

AISI 316 (GHV20../A316)

For special applications

Manifolds, valves, non-return valves and main components with parts directly in contact with the pumped liquid are made of AISI 304 or AISI 316 stainless steel.

Accessories available on request:

- Devices **against dry running** in one of the following versions:
 - float switch, for positive suction head;
 - probe electrodes kit, for positive suction head;
 - minimum pressure switch, for positive suction head.
- **Surge tank** in the following versions:
 - Air-cushion surge tank with compressor and accessories for surge tank and compressor.
 - Diaphragm vessel as an alternative to the air-cushion tank.
- **Kit featuring** 24 or 20-litres **diaphragm expansion vessel** with 1" ball valve, in the following versions, depending on the maximum head of the pumps:
 - 24-litre 8 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit
 - 24-litre 10 bar cylinder water vessel kit, Aisi 304
 - 24-litre 10 bar cylinder water vessel kit
 - 20-litre 25 bar cylinder water vessel kit
- **Alarm kit;**
- **Air feeder** for **RA** version.

SPECIAL VERSIONS AVAILABLE ON

REQUEST

(Contact the Sales and technical Assistance Service)

- Support base in AISI 304, AISI 316 stainless steel.
- Units with stainless steel expansion vessels.
- Units with special valves.
- Sets with 5 electric pumps.
- Sets with 6 electric pumps.
- Sets with jockey pump.

TWO-PUMP BOOSTER SETS, GHV20 SERIES VARIABLE-SPEED PUMP SYSTEMS

AVAILABLE SERIES

GHV Multi-Master series. One Hydrovar® Master-type frequency converter for each electric pump.

GHV Master + Basic series. One Hydrovar® frequency converter for each electric pump.

Hydrovar® Master and/or Basic type.

GHC Cascade control series. Single Hydrovar® Master type frequency converter per set; the other electric pumps run at fixed speed, without a converter.

From a mechanical standpoint, the **Module concept** related to **HYDROVAR®** is divided in two parts, the **motor assembly** power unit (power unit) and the **control board**. In the basic configuration, that is with a single motor assembly, HYDROVAR® may be used as "**Basic Unit (BASIC)**" without having to use a control board. In this configuration HYDROVAR® may be used as a sequential pump in a multi-pump system with at least one master inverter.

By expanding the "Basic inverter" with the additional control board and the LCD screen, the HYDROVAR® "**Master Unit**" becomes suitable to operate in different modes and may be expanded by implementing several modules.

GHV VERSION, MASTER + BASIC SERIES

This mode provides several different combinations of different HYDROVAR® versions.

In general, each pump is equipped with a HYDROVAR® unit. Each pump in the system (which may count up to 8 pumps), is fitted with a HYDROVAR® unit (at least one as "**Master unit**" and the others as "**Basic units**", to guarantee adequate system control); the units are connected one another by means of a serial interface.

Minimum requirements: one "Master unit" and the others equipped with "Basic unit".

The entire control process takes always place by means of the "Master unit", though it is also possible to alternate the standby pump sequence in order to distribute wear and allow for the same number of operating hours of the pumps controlled by basic inverters.

Following versions are available:

- **Power size from 1,5kW to 11 kW, motor mounted.**

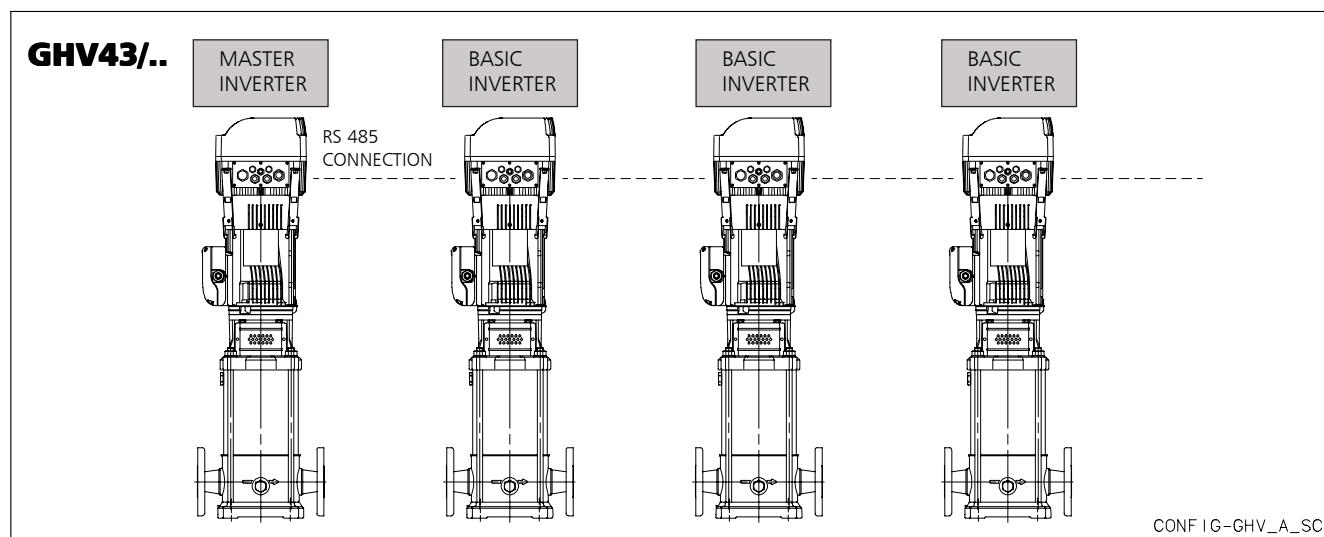

General description of booster name:

GHV [][]: First digit: total number of pump, Second digit: number of Basic units.

Example:

- **GHV21**: two pumps booster set, one "Master Inverter" and one "Basic Inverter" configuration.
- **GHV31**: three pumps booster set, two "Master Inverter" and one "Basic Inverter" configuration.
- **GHV32**: three pumps booster set, one "Master Inverter" and two "Basic Inverter" configuration.

GHV20

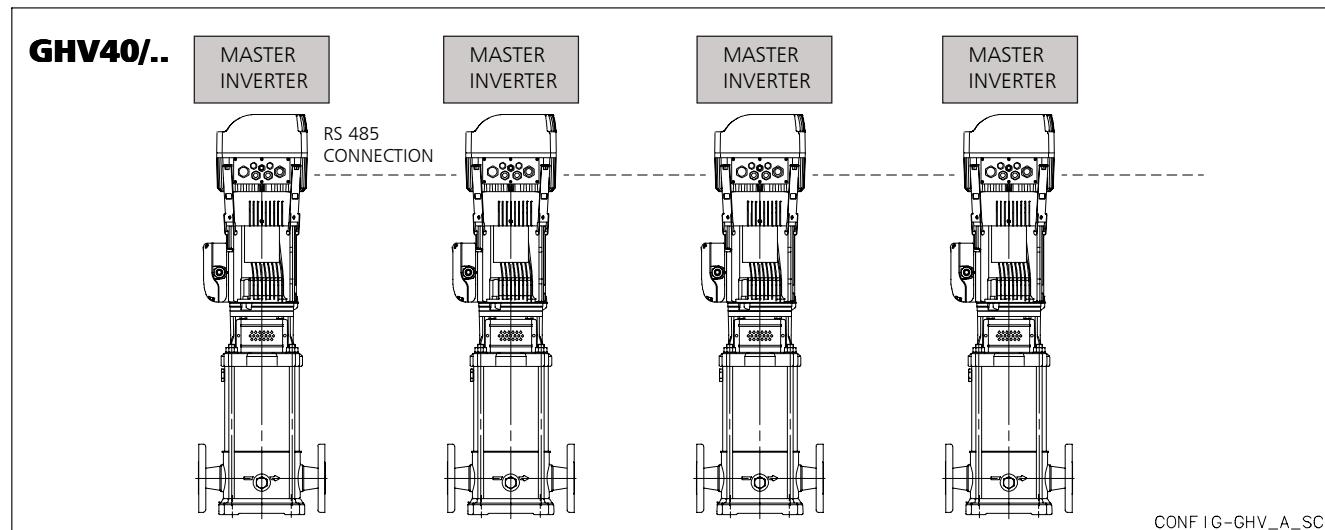

TWO-PUMP BOOSTER SETS, GHV20 SERIES MULTI MASTER SERIES

Each electric pump is fitted with a HYDROVAR® type "Master Unit".

Automatic alternation of the electric pumps is guaranteed in order to distribute wear and optimize the operating hours. The following power levels are available:

- **Power from 1,5kW to 22 kW, motor assembly (maximum 8 units).**

GHC VERSION, CASCADE CONTROL SERIES

One pump is equipped with a HYDROVAR® "Master unit", while up to five fixed-speed pumps may be operated on request with the ON and OFF signal.

For this purpose an additional 5-relay board is fitted on to the "Master unit". It is necessary to resort to an external electric panel, in that the HYDROVAR® relays are not capable of directly commutating the pumps, since they are used exclusively as signal terminals.

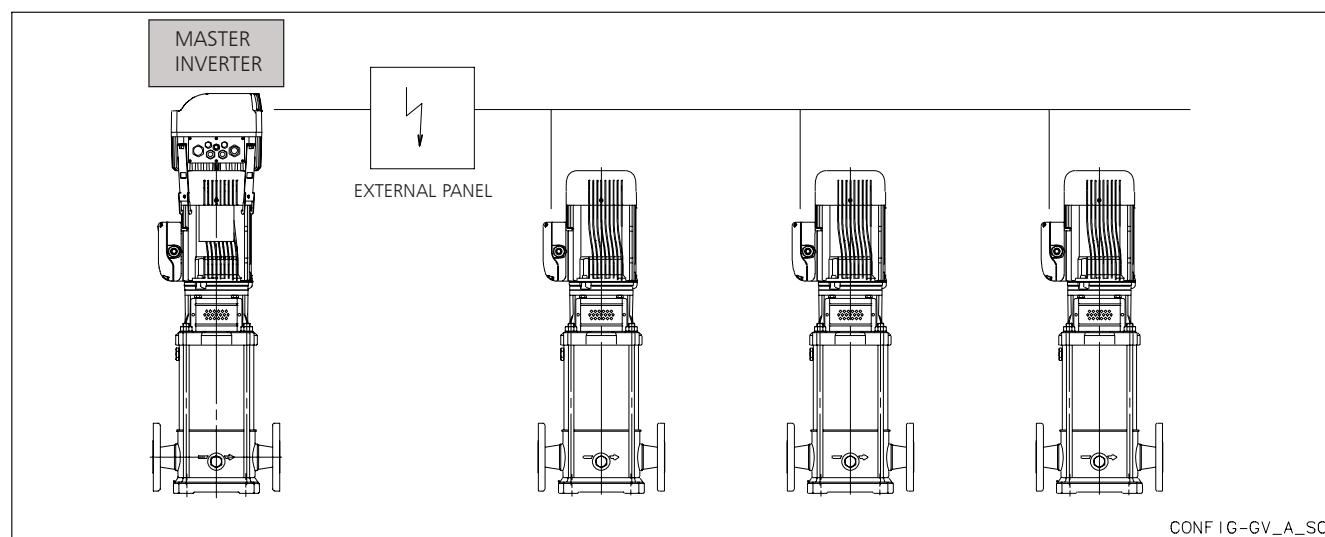

In this operating mode it is also possible to automatically alternate the fixed-speed pumps in order to distribute wear and allow the pumps to operate for the same number of hours. The inverter always feeds the same electric pump.

The following power levels are available:

- **Power from 1,5kW to 22 kW, motor assembly (maximum 6 electric pumps)**

Example:

- **GHC20:** pressure booster assembly made up of two pumps, a "Master inverter" and an electric pump running at fixed speed.
- **GHC30:** pressure booster assembly made up of three pumps, a "Master inverter" and two electric pumps running at fixed speed.

MAIN CHARACTERISTICS OF FREQUENCY CONVERTERS USED IN THE BOOSTER SETS GHV, GHC SERIES

The GHV, GHC series booster sets use a **Hydrovar®** frequency converter, an automatic device that adjusts the speed of the electric pump in order to maintain **constant pressure** in the system.

Converters with power up to 22 kW can be **mounted directly on to the motor**.

Models up to 22 kW can be mounted alternatively on the wall if equipped with the optional **fan kit**. Models with over 22 kW power, up to 45 kW, are designed for wall mounting only.

The pressure is measured by a **pressure transmitter** which uses a standard **4..20 mA** signal. The system pressure value can be read on the converter's display.

A simple user interface allows you to set the desired pressure value for optimal adjustment, as well as to

view the operating data, such as the hours of operation and any alarms triggered.

Included diagnostic menu to view temperature, current and voltage values of Hydrovar® facilitates diagnostics and failure analysis.

Indicator lights signal power status, pump running and malfunctions.

A **password** is required to access sensitive settings that allow you to **configure the converter** in order to adapt it to any control requirements, such as **flow resistance compensation, external control**, periodic testing and so on.

When more than one pump is used, the converters exchange information with each other through an

RS485 serial line which can connect up to 8

Hydrovar® devices plus one external unit for remote control.

Up to 4 Hydrovar® for power ratings from 30 to 45kW.

The Pump-link and Pump-watcher dedicated systems, connected to Hydrovar®, allow remote control with a mobile or landline telephone system.

RS485 serial interface available as standard up to 22 kW, which allows to control the Hydrovar® converters from a Modbus® field serial bus line.

The converter is equipped with two **potential-free relays** which can be used for **remote signalling** of pump running and malfunction status, plus a programmable voltage **analogue output** for signalling the frequency or pressure.

Standard version with two sensors inputs for implementing of two actual values signals within one system (min/max, difference) or for a second sensor for safety reasons.

Specific digital **inputs** are used for protection against **water failure, motor overtemperature**, as

well as for external enable signal and remote control.

The converter also incorporates a dry running protection function via an adjustable **minimum pressure** threshold.

Hydrovar® HV2.015 - HV4.110

Hydrovar® Wall mounted version

Hydrovar® HV4.150 - HV4.220

Class A filter standard for Hydrovar® three-phase power supply. E.g. Industrial areas, technical areas of any building fed from a dedicated transformer are examples of environment locations.

Class B filter standard for Hydrovar® single-phase power supply. E.g. Houses, apartments, commercial premises or offices in a residential building are examples of environment locations.

Further information are available into Hydrovar® manual.

TWO-PUMP BOOSTER SETS, GHV20 SERIES SPECIFICATIONS

* The Hydrovar Modular is available single-phase up to 2,2kW and above 2,2kW up to 22kW three-phase power supply only.

gcom_hv-2p-en_d_te

CONTROL PANELS

Single-phase (GHV..M) or three-phase (GHV..T) electrical power supply panel for protecting up to two three-phase electric pumps (3x230Vac or 3x400Vac), with Hydrovar® frequency converter, made from polycarbonate, featuring a transparent door and protected to IP55 for power ratings up to 4kW. A metal case protected to IP55 is available on request.

Main characteristics:

- Automatic switch with overload protection for each Hydrovar® frequency converter.
- Standard supply voltage: 1x230Vac (GHV..M) or 3x400Vac (GHV..T) +/-10%, 50/60Hz.
- No-water protection system alternatives: float, minimum pressure switch, external contact or electrode probes via the electronic module with sensitivity adjustment.
- A special version with "clean" potential-free contacts for signalling: pump running, converter faulty. Configured for enable from external contact.

A Hydrovar® frequency converter, integrated to the motor of each pump, which controls the number of revs required to keep pressure constant and complete with: power-on, pump running and fault indicator LED's, control buttons. Complete with two relays for remote pump running and alarm signalling.

A serial line for transmitting information between the two units in order to assure cycle exchange, simultaneous operation in case of maximum demand and service continuity in case one of the two converters develops a fault. The standard external serial line can be used to connect a control system.

Control panel 2 pumps single-phase up to 2,2kW, or three-phase power supply up to 4kW

Control panel 2 pumps three-phase power supply with dry contacts up to 4kW

ENERGY SAVING

The worldwide demand for energy is growing all the time and, while the demand is increasing, production is coming up against serious problems of an environmental nature and related to the supply of raw materials. In other words, energy is an asset that is becoming more precious every day, imposing choices to optimise consumption, especially with a view to safeguarding the environment.

A very important improvement role is played by new technologies which include, among the most desirable parameters, environmental protection and energy saving as well as best technical performance. Drives for electric motors fall into this category. As well as making a considerable contribution to the decrease in energy consumption and consequently to the improvement of the environment, in many applications they also produce a notable reduction in the overall costs of running the installations.

Drives for Electric Motors

The electronic drives that are most involved in the general improvement of the quality of systems and installations, are those for asynchronous alternating current motors, generally three-phase induction motors. They may be divided into two large categories:

- Drives with variable voltage
- Drives with variable frequency

The first, called "starters" or "soft starters", are appliances that operate at constant frequency (that of the power mains), dose the voltage supplied to the load and have limited current.

The following figure illustrates the typical operation of the "soft starter":

The second, called "Inverters" or "frequency converters" are most important from the point of view of energy saving and are able to supply the motor with a practically sinusoidal current (PMW) at a frequency that may vary from a value of practically 0 Hz to a rated frequency and beyond, with a constant flow (torque) or constant power. Typical example, fig.2:

The applicatory advantages of the two categories of drives will be described below.

Softstart

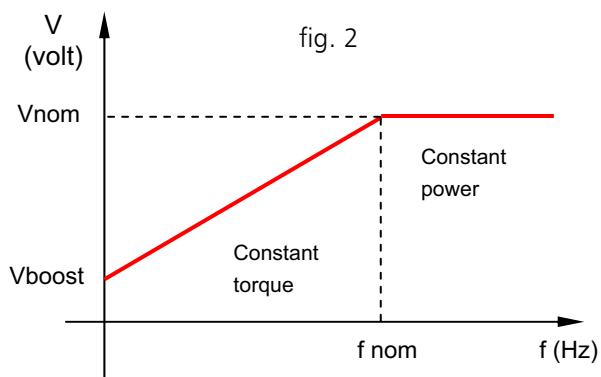

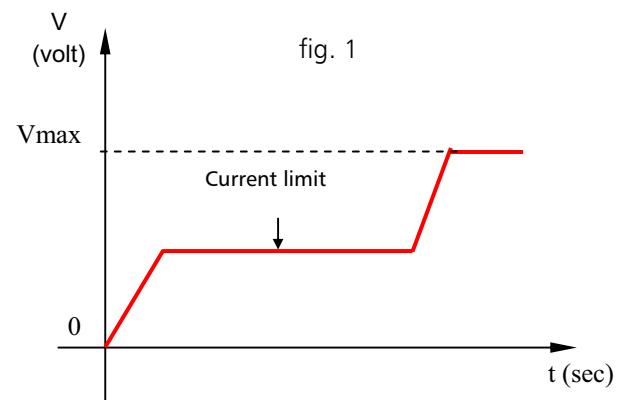

The direct starting of an asynchronous motor presents considerable difficulties due to the peak current in the start phase. Typically the value of the starting current is about 7/8 times the rated current of the motor.

Direct start systems are therefore not generally convenient (except for small power); mainly because of the need to increase the size of the power supply mains (switches, fuses, etc. ...), and also problems of a mechanical nature, due to high stress in the start phase which in the medium/long term may prove to be destructive.

The electrical engineering industry has already found various practical solutions to the problems; the main ones are noted below:

- Special motors with double winding
- Starting with autotransformer
- Star/delta starting

These starting systems are certainly an improvement on direct starting, but they do not solve the problem. The advent of electronic starters ("soft starters") made a decisive contribution to solving the question.

ENERGY SAVING

This type of drive is able to supply performance advantages:

- Progressive start with a voltage ramp having a duration adjustable within wide time limits.
- Limited current start with a value that can be set from 100% to 500% of the rated value.
- Descending voltage ramp having a duration adjustable within wide time limits.
- Voltage ramps at starting and stopping adaptable to particular operations (pumps).
- Low-speed operation, with reversible running direction, for specific applications.
- "Energy Saving" function with automatic reduction of the voltage/current in the case of a prolonged underload.
- Safety devices that can be calibrated to prevent overheating of the motor, over/under currents and over/under voltages.
- Safety devices that can be calibrated to prevent prolonged or too frequent starts.
- Possibility of by-pass operation after starting, keeping all the safety devices active.

All these features make the electronic starter the ideal tool for solving the problems we have mentioned. With the recently designed starters, with both analog and digital control, it is possible to obtain considerable softer and more efficient starts than any other electromechanical system was able to achieve. Moreover, thanks to the intrinsic control and protection systems of the starter, it is generally possible to eliminate other protection equipment that would otherwise be necessary in the system.

In conclusion, in many applications, one can SAVE on:

- Structure and auxiliary equipment of the power supply system.
- Protection of the mechanical system against excessive stress.

Speed Adjustment

The speed adjustment systems allow energy consumption in proportion to the use of the system based on user demand. This allows considerable savings in systems working on a daily basis (24h).

Alongside applications that require operation of the electric motors at a constant speed, with steady voltage and frequency, there are many in which the electric motor must be able to vary its speed of rotation (frequency); moreover, in many applications the process control obtained by varying the speed (adjustment of flow rate, pressure, etc...) is much more convenient than any other method of adjustment.

For these applications the most suitable drives are certainly frequency converters, referred to below as "Inverters", which can supply the motor with the desired torque from a few rpm up to the rated speed beyond which they are still able to operate at constant power with a decreasing torque. The advantage of using the Inverter lies in the greater efficiency of the performance that it is able to give in comparison with electromechanical controls.

A useful application of frequency converters may simply be that of obtaining a soft start for a load that is particularly heavy to start (pump) and variable over time (flow rate). In any case the advantage of a soft start is present in all inverter-controlled systems for starting a motor, even in cases where speed adjustment is not needed.

The advantage is due to the fact that the inverter is able to supply the rated torque (with possibility of 150% overload with respect to the rated current), right from frequency zero. This is possible because the voltage to the motor, generated by the inverter, is in phase with the number of revolutions right from the start (unless the motor is running). In this way the losses in the motor are considerably reduced.

The starting torque that can be obtained using the inverter is greater than that obtained with a soft starter, and the demand for current in the whole starting phase is much lower.

The yearly saving, for a lost power of 40000 Kwh, with electromechanical start, may be as much as 2000 Euro.

The reliability and efficiency of the pump speed control systems means optimising consumption and processes as well as savings. In the specific case of pumping appliances, the immediate consequence of the use of these systems is the realisation of pumps with greater operative flexibility, with much larger and optimal performance curves. There are many advantages – above all, a pump that always works, irrespective of variations in the installation, in optimal conditions with less wear and less malfunctions. So there are less problems from downtime and the pumps require less frequent maintenance. Moreover, an installation where the pumps are controlled by an inverter is more efficient and less subject to stress:

- absence of water hammer (which occurs when switching off pumps driven in a traditional way);
- lower working pressures than systems with an autoclave or piezometric tank;
- pressure and flow rate conditions always adequate for the demands, because the inverter is able to adjust the pump gradually in real time according to the pressure trend in the installation.

ENERGY SAVING

All this results in less stress on all the components in the distribution network, and therefore in less maintenance of the network, greater reliability of supply and lower running costs.

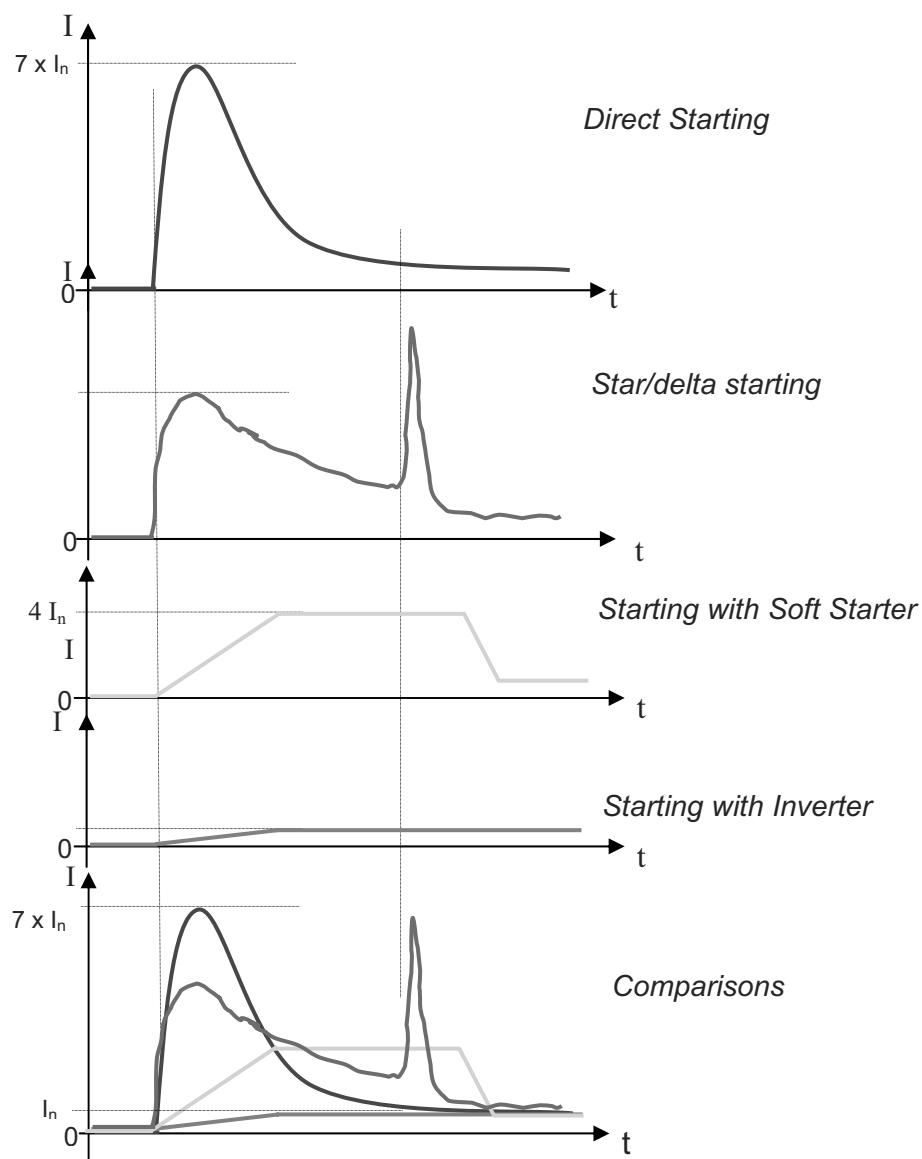

In short, using a pumping system with one or more variable-speed pumps means:

- ✓ Saving energy;
- ✓ Optimising resources and processes;
- ✓ Having the possibility of complete integration of the management, control and supervision systems;
- ✓ Prolonging the life of the installations;
- ✓ Reducing maintenance costs;

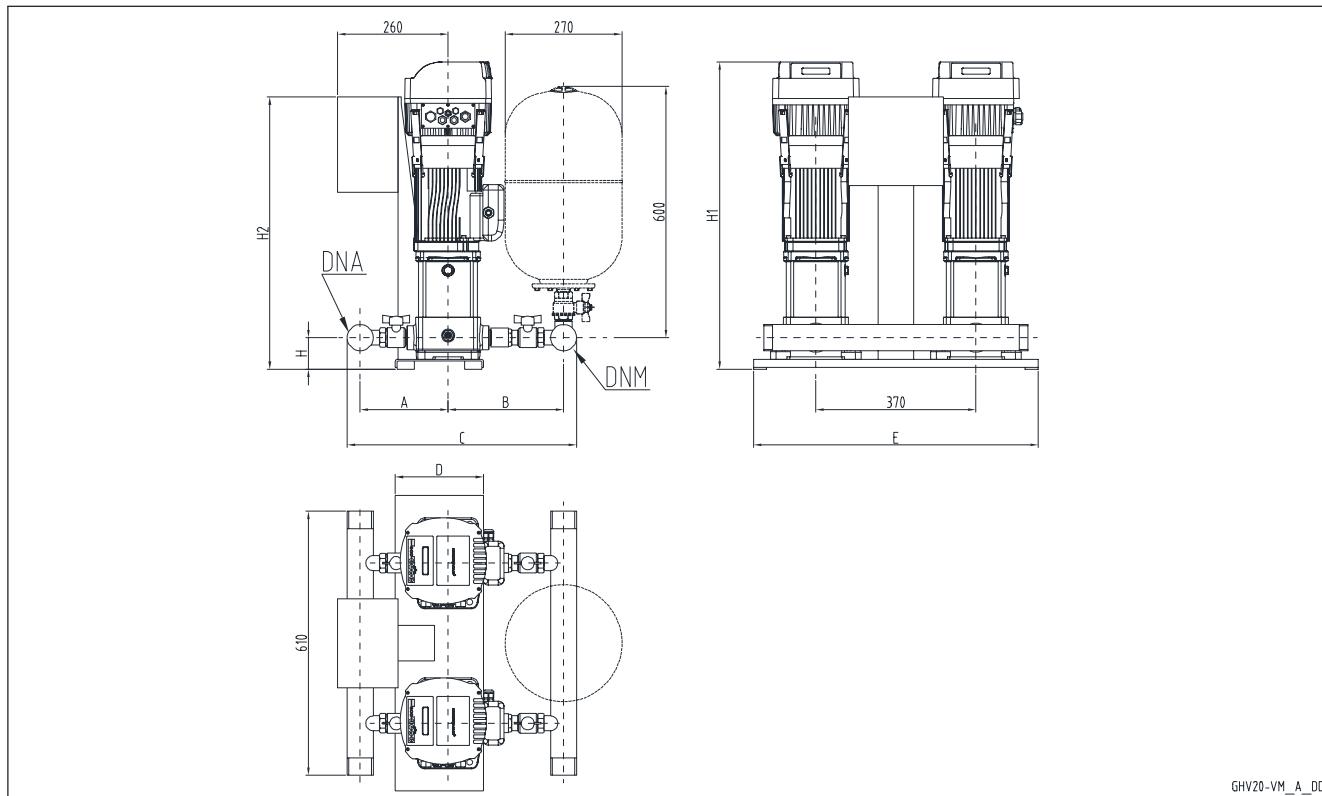

Increasing the productivity and efficiency of an installation.

Comparison of starting systems

Having examined the various starting systems that can be realised for electric motors, direct start, star/delta, soft starter and inverter, they can be compared, analysing the absorbed currents and therefore the energy consumed (current = energy = kWh = MONEY)

ONE-PUMP SPHERE UNITS OPERATING CHARACTERISTICS AT 50 Hz

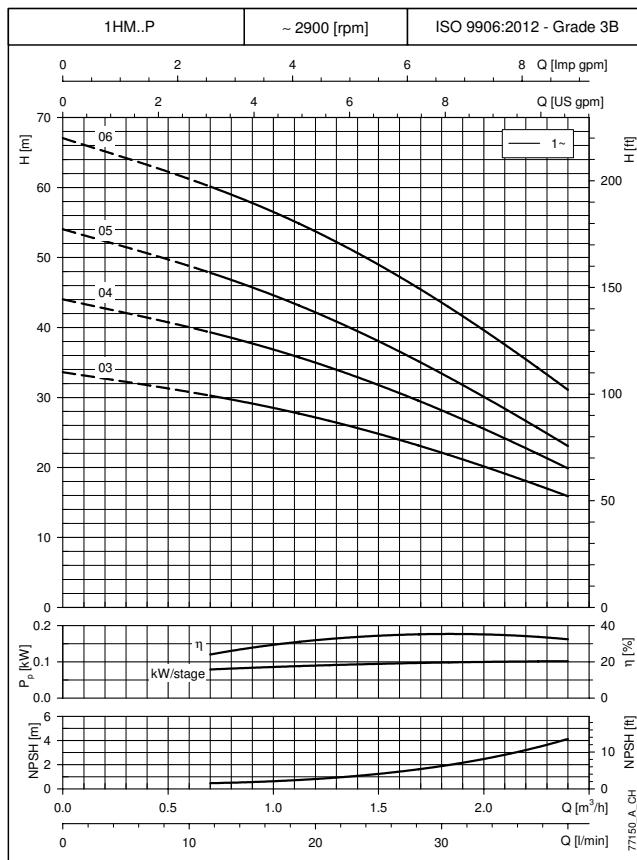

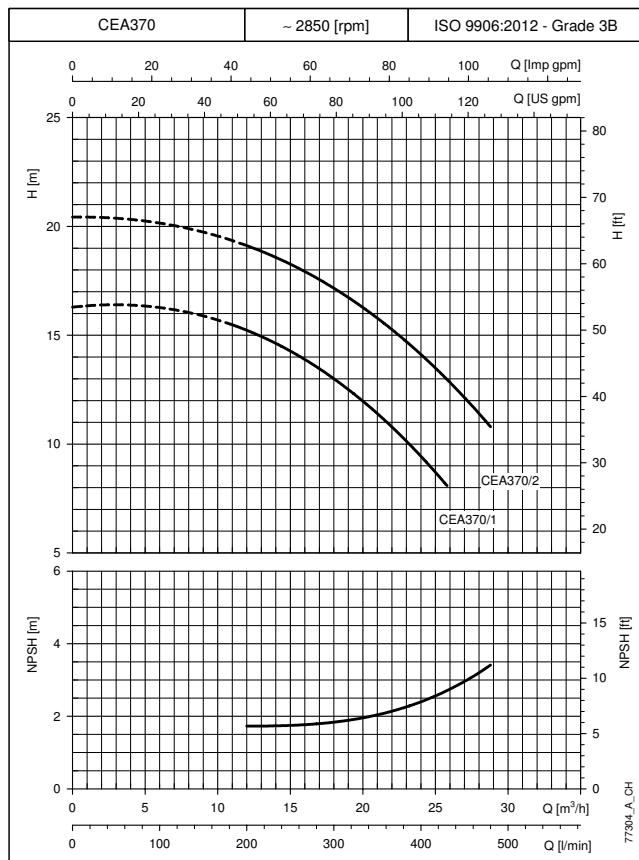

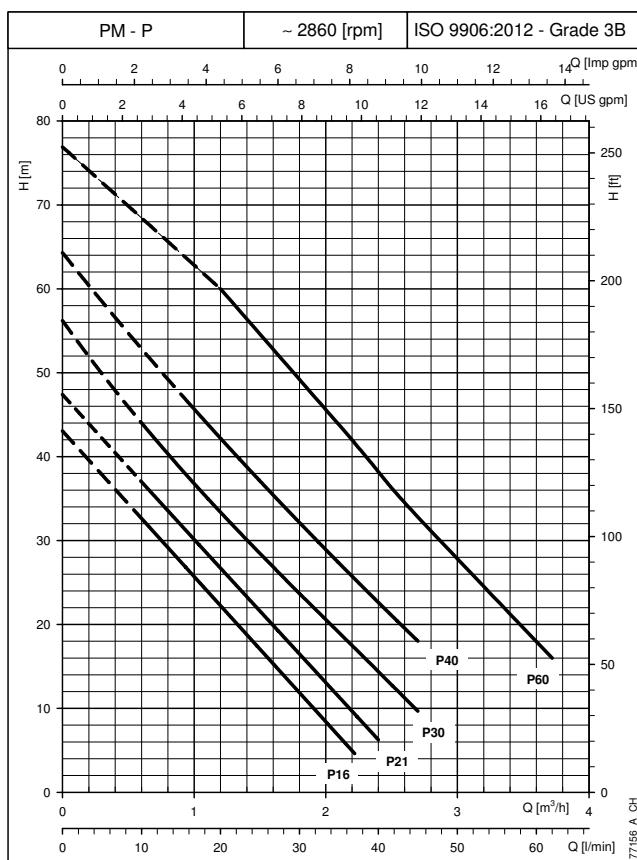

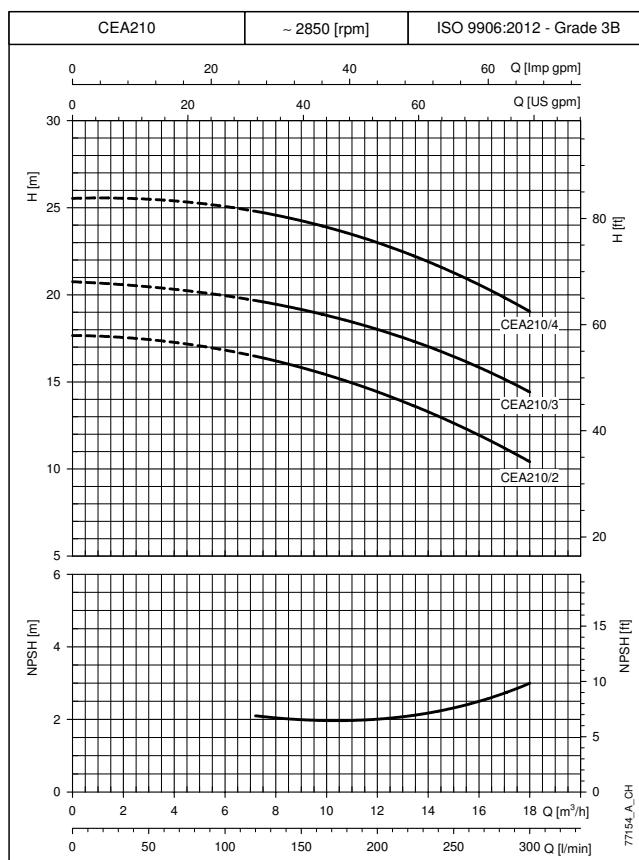

The performance curves do not take into account flow resistance in the valves and piping.

The curves show the performance with one pump running.

These performances are valid for liquids with density $\rho = 1.0 \text{ Kg/dm}^3$ and kinematic viscosity $\nu = 1 \text{ mm}^2/\text{s}$.

The declared NPSH values are laboratory values: for practical use we recommend increasing these values by 0,5 m.

TECHNICAL APPENDIX

**TECHNICAL
APPENDIX**

WATER REQUIREMENTS IN CIVIL USERS

Determination of the water requirement depends on the type of users and contemporaneity factor. The calculation may be subject to regulations, standards or customs that may vary from country to country. The calculation method shown below is an example based on practical experience, designed to provide a reference value and not a substitute for detailed analytical calculation.

Water requirements in condominiums

The **consumption table** shows the maximum values for each delivery point, depending on the plumbing amenities.

MAXIMUM CONSUMPTION FOR EACH DELIVERY POINT

TYPE	CONSUMPTION (l/min)
Sink	9
Dishwasher	10
Washing machine	12
Shower	12
Bathtub	15
Washbasin	6
Bidet	6
Flush tank WC	6
Controlled flushing system WC	90

G-at-cm_a_th

The **sum of the water consumption values** of each delivery point determines the maximum theoretical requirement, which must be reduced according to the **contemporaneity coefficient**, because in actual fact the delivery points are never used all together.

$$f = \frac{1}{\sqrt{(0,857 \times Nr \times Na)}} \quad \text{Coefficient for apartments with one bathroom and flush tank WC}$$

$$f = \frac{1}{\sqrt{(0,857 \times Nr \times Na)}} \quad \text{Coefficient for apartments with one bathroom and controlled flushing system WC}$$

$$f = \frac{1,03}{\sqrt{(0,545 \times Nr \times Na)}} \quad \text{Coefficient for apartments with two bathrooms and flush tank WC}$$

$$f = \frac{0,8}{\sqrt{(0,727 \times Nr \times Na)}} \quad \text{Coefficient for apartments with two bathrooms and controlled flushing system WC}$$

f = coefficient; Nr = number of delivery points; Na = number of apartments

The **table of water requirements in civil users** shows the maximum contemporaneity flow-rate values based on the **number of apartments** and the type of WC for apartments with one bathroom and two bathrooms. As regards apartments with one bathroom, 7 drawing points have been taken into consideration, while 11 points have been considered for apartments with two bathrooms. If the number of drawing points or apartments is different, use the formulas to **calculate** the requirement.

**TABLE OF WATER REQUIREMENTS

180	425	530	811	1056
200	448	559	854	1114

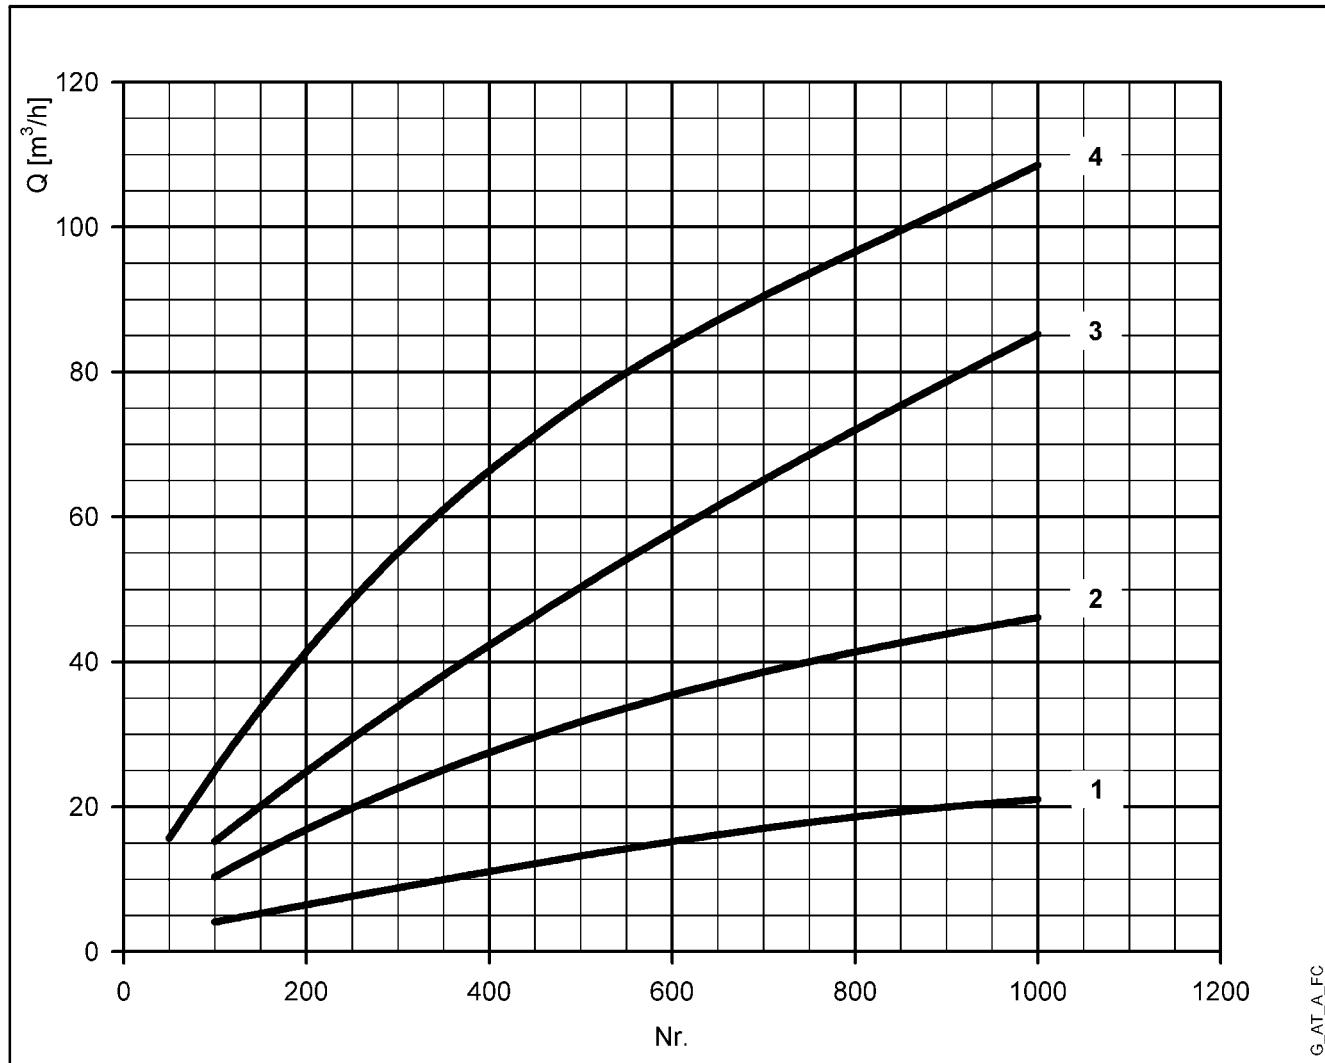

For seaside resorts, a flow rate increased by at least 20% must be considered.

G-at-fi_a_th

WATER REQUIREMENTS FOR COMMUNITY BUILDINGS

The requirements of buildings intended for specific uses, such as **offices, residential units, hotels, department stores, nursing homes** and so on, are different from those of condominiums, and both their global daily water consumption and the maximum contemporaneity flow rate are usually greater. The **diagram of water requirements for community buildings** shows the maximum contemporaneity flow rate of some types of communities, for guidance.

These requirements must be determined case by case with the utmost accuracy, using analytical calculation methods, according to particular needs and local provisions.

For seaside resorts, the flow rate must be increased by at least 20%.

- 1 = Offices (N. of people)
- 2 = Department stores (N. of people)
- 3 = Nursing homes (N. of beds)
- 4 = Hotels, residences (N. of beds)

USE OF BOOSTER SET

Water is usually delivered by public supply systems and the pressure is generally sufficient for the proper operation of the users' water and sanitary equipment.

When this pressure is not sufficient, booster sets are employed to increase water pressure and ensure an acceptable minimum value at the furthest points. Therefore, the water supply to a building, group of buildings or to a system in general can be considered satisfactory when all the user points can deliver the required quantity of water.

Set connection methods (intake side)

Water can be supplied to a booster set in two ways:

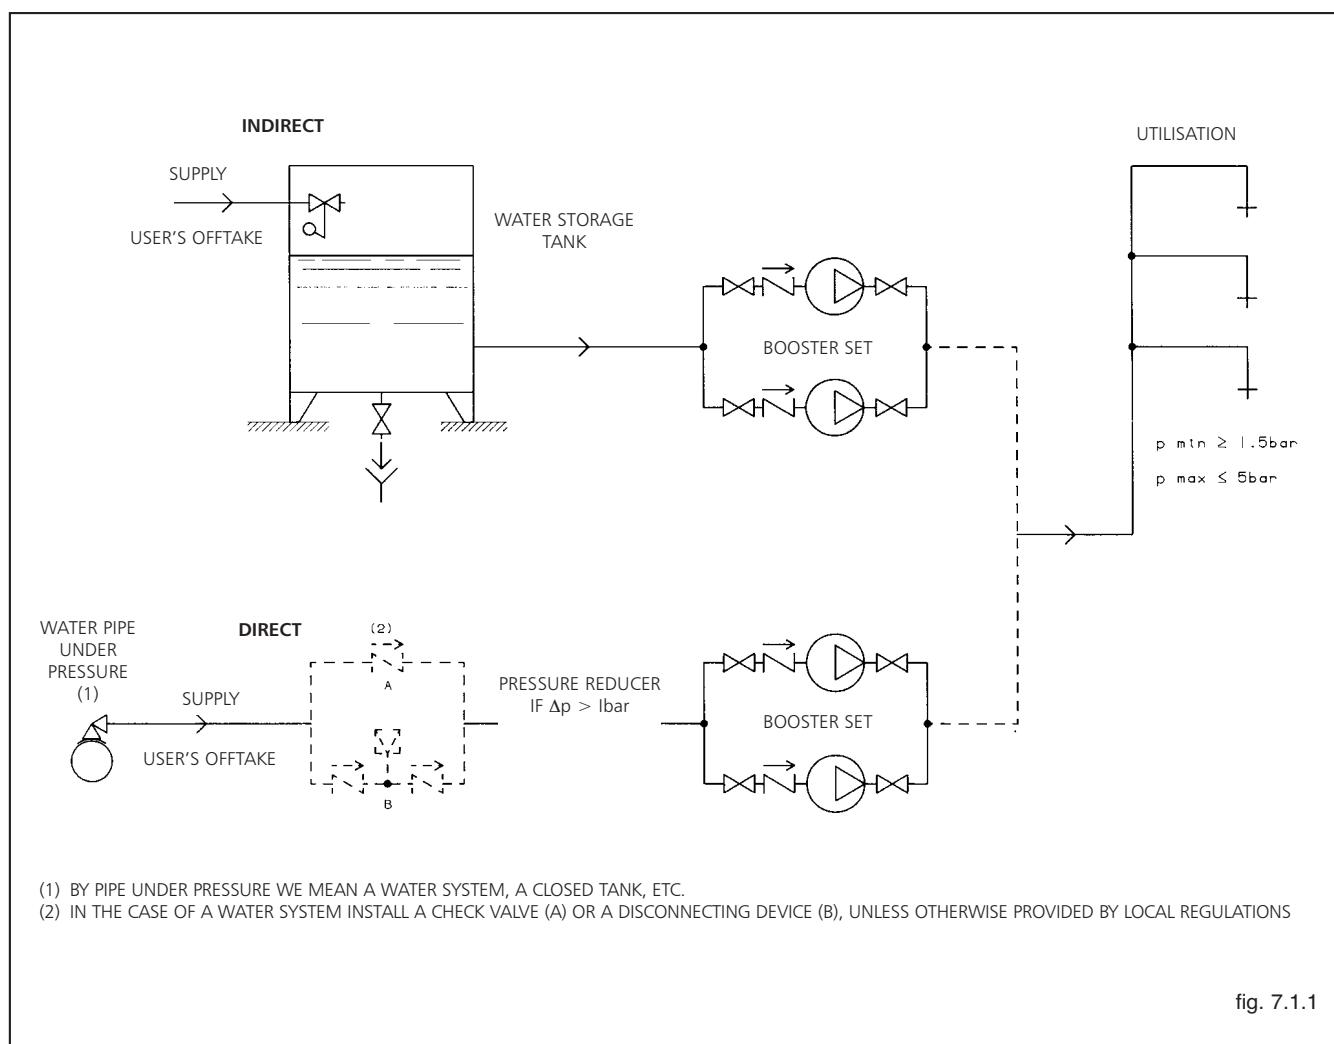

1 - By installing a water storage tank between the user's offtake and the booster set (indirect connection, fig. 7.1.1).

2 - By connecting the booster set directly between the user's offtake and the system (direct connection, fig. 7.1.1).

The indirect connection does not allow the water system pressure to be utilized. Therefore, it requires pumps with greater head.

The direct connection allows the water system pressure to be utilized, provided the pressure fluctuation (Δp) does not exceed 1 bar.

If it does, a pressure reducer must be installed for proper operation of the booster set.

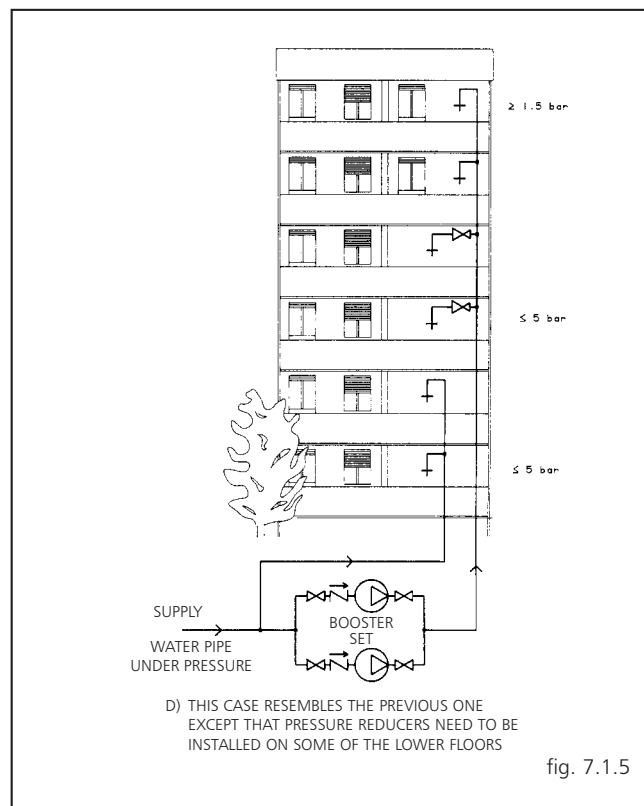

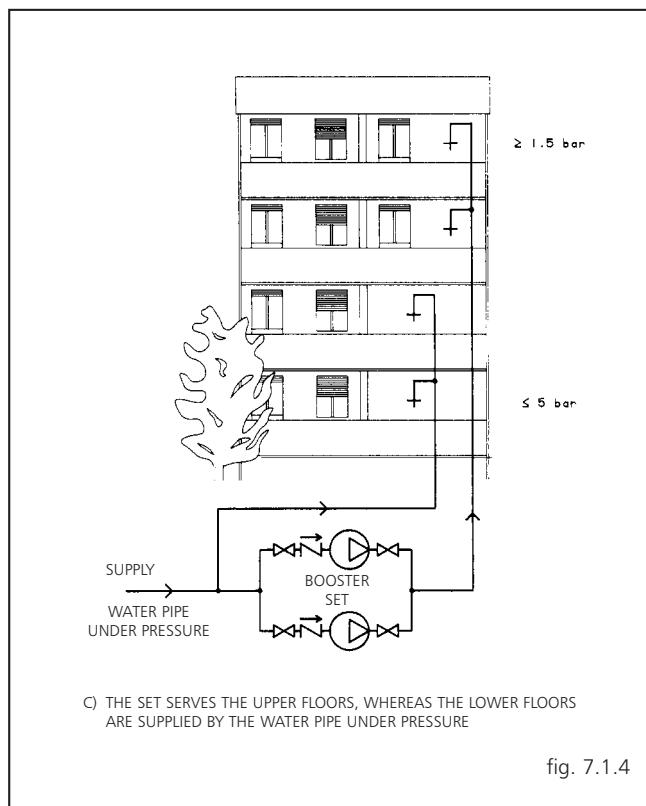

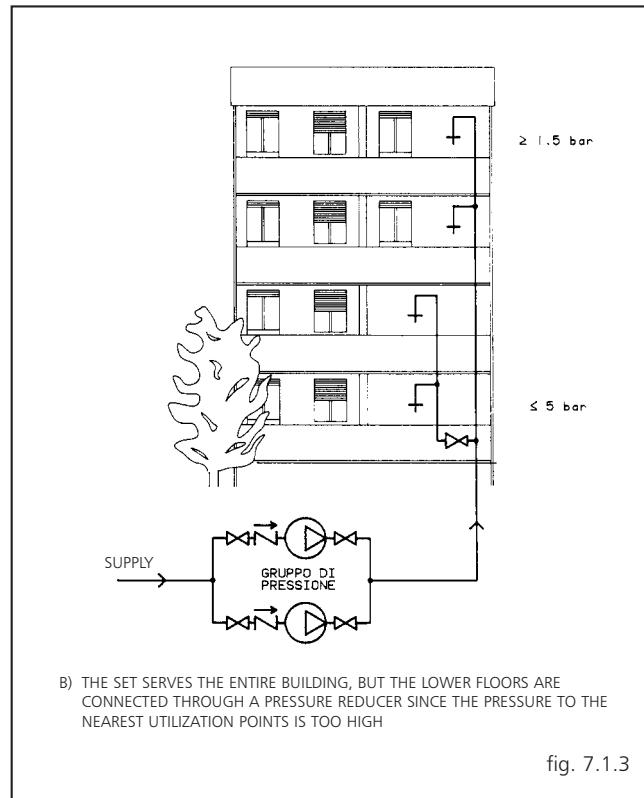

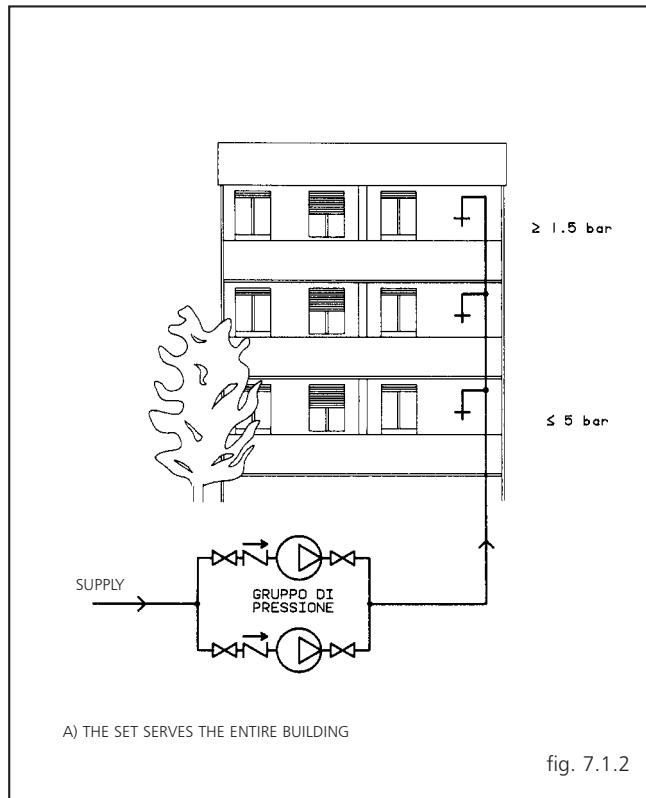

Water supply systems in civil buildings

The configuration of the supply system must comply with the following conditions:

- The minimum pressure ensuring the proper operation of the equipment must be guaranteed at the most unfavourable drawing point (1.5 bar for valves and flush tank WC, and 2 bar for controlled flushing system WC).
- At the most favourable drawing point, pressure must not exceed 5 bar.

Once these parameters have been satisfied, in relation to the height of the building and to the set intake conditions, the water supply system can have one of the following configurations:

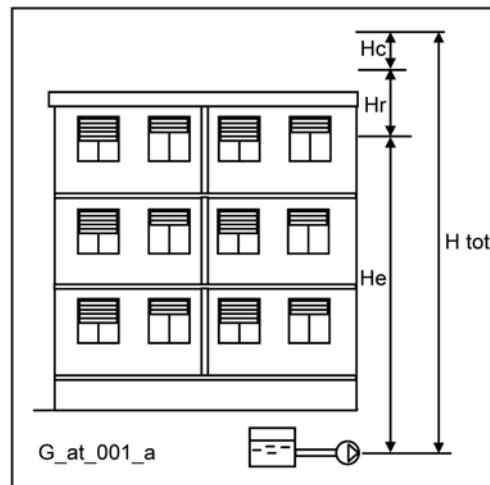

DETERMINING THE HEAD OF THE SET AND INTAKE CONDITIONS

Level intake

The delivery head of the set (H_{tot}) is the sum of:

- He : geodetic difference in level between the set and the furthest delivery point.
- Hc : flow resistance along all the pipes and through other system components, such as valves, filters, etc..
- Hr : pressure required at the most unfavourable point.

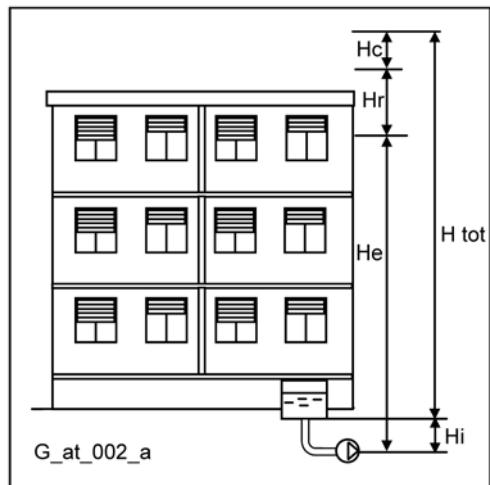

$$H_{tot} = He + Hc + Hr$$

Intake with positive head

In this case, the necessary delivery head (H_{tot}) will be reduced by the inlet pressure value (Hi).

$$H_{tot} = He + Hc + Hr - Hi$$

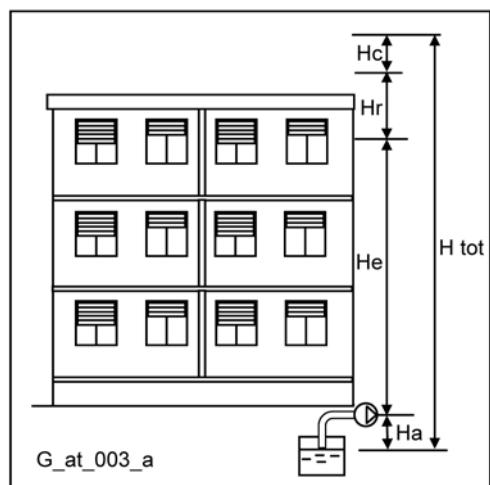

Intake with negative head

When the pumps suck from an underground tank or well, the necessary head will be increased by the value of the intake height (Ha):

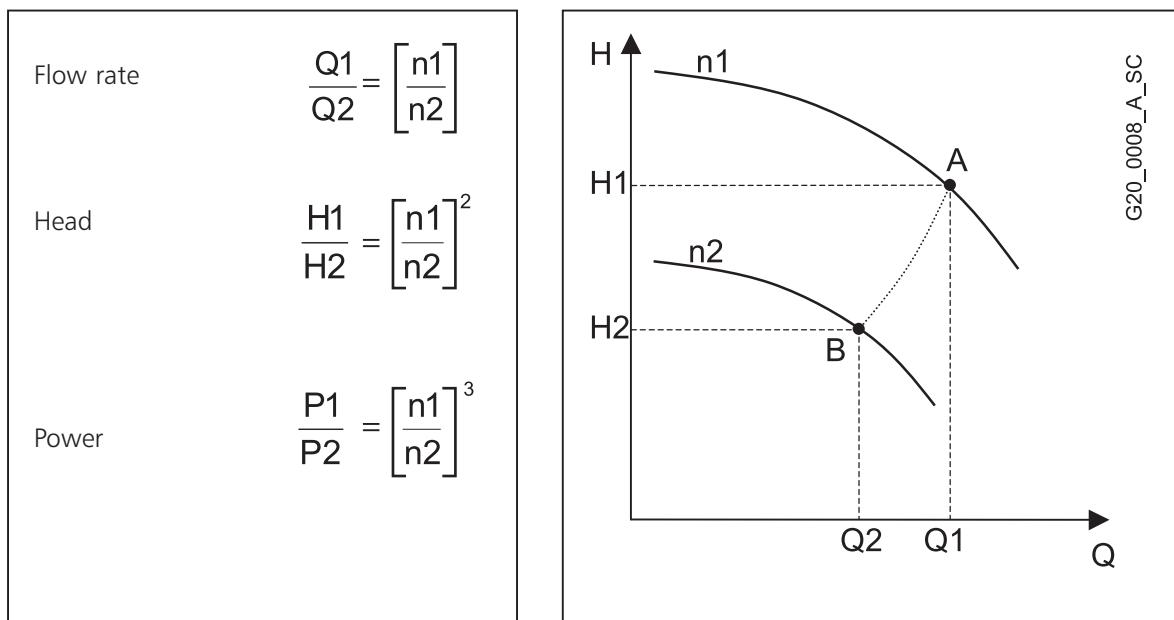

$$H_{tot} = He + Hc + Hr + Ha$$

In this case the intake height must be considered very carefully, bearing in mind that an excessive difference in level between the water storage tank and the set, or the wrong sizing of the intake pipe, can have adverse effects on pump operation, such as cavitation and unpriming.

PERFORMANCE WITH VARYING SPEED EQUIVALENCE RELATIONS

Fitting the electric pump with a frequency converter makes it possible to vary the pump rotation speed, normally according to the system pressure parameter. **Variations in electric pump speed** result in **modified performances** according to the equivalence relations.

n_1 = initial speed;

Q_1 = initial flow rate;

H_1 = initial head;

P_1 = initial power;

n_2 = speed required.

Q_2 = flow rate required.

H_2 = head required.

P_2 = power required

Frequency ratios can be used instead of speed in practical applications, keeping 30 Hz as the bottom limit.

Example : 2-pole 50 Hz electric pump $n_1 = 2900$ (point A)

Flow rate (A) = 100 l/min; Head (A) = 50m

By reducing the frequency to 30 Hz the speed is reduced to approx. $n_2 = 1740$ rpm (point B)

Flow rate (B) = 60 l/min; Head (B) = 18 m

The power of the new work point B is cut to about 22% of the initial power.

SIZING THE DIAPHRAGM TANK IN SYSTEMS WITH SPEED VARIATION

Variable speed booster sets need **smaller tanks** compared to traditional systems. Generally speaking, a tank with a litre capacity of just 10% of the nominal capacity of a single pump, expressed in litres per minute, is needed. The **gradual starting** of the pumps controlled by the frequency converters reduces the need to limit the number of hourly starts; the main purpose of the tank is to compensate for small system losses, stabilize the pressure and make up for pressure variations caused by sudden demand.

Make the following calculation:

Set made up of three electric pumps, each with a maximum flow rate of 400 l/min, for a total capacity of 1200 l/min. The **volume** required for the tank is 40 litres. This size can be obtained by using two 24-litre tanks mounted directly onto the set's manifold.

The calculation establishes the minimum value needed for proper operation.

NPSH

The minimum operating values that can be reached at the pump suction end are limited by the onset of cavitation.

Cavitation is the formation of vapour-filled cavities within liquids where the pressure is locally reduced to a critical value, or where the local pressure is equal to, or just below the vapour pressure of the liquid.

The vapour-filled cavities flow with the current and when they reach a higher pressure area the vapour contained in the cavities condenses. The cavities collide, generating pressure waves that are transmitted to the walls. These, being subjected to stress cycles, gradually become deformed and yield due to fatigue. This phenomenon, characterized by a metallic noise produced by the hammering on the pipe walls, is called incipient cavitation.

The damage caused by cavitation may be magnified by electrochemical corrosion and a local rise in temperature due to the plastic deformation of the walls. The materials that offer the highest resistance to heat and corrosion are alloy steels, especially austenitic steel. The conditions that trigger cavitation may be assessed by calculating the total net suction head, referred to in technical literature with the acronym NPSH (Net Positive Suction Head).

The NPSH represents the total energy (expressed in m.) of the liquid measured at suction under conditions of incipient cavitation, excluding the vapour pressure (expressed in m.) that the liquid has at the pump inlet.

To find the static height h_z at which to install the machine under safe conditions, the following formula must be verified:

$$hp + h_z \geq (NPSH_r + 0.5) + hf + hp_v \quad ①$$

where:

hp is the absolute pressure applied to the free liquid surface in the suction tank, expressed in m. of liquid; hp is the quotient between the barometric pressure and the specific weight of the liquid.

h_z is the suction lift between the pump axis and the free liquid surface in the suction tank, expressed in m.; h_z is negative when the liquid level is lower than the pump axis.

hf is the flow resistance in the suction line and its accessories, such as: fittings, foot valve, gate valve, elbows, etc.

hp_v is the vapour pressure of the liquid at the operating temperature, expressed in m. of liquid. hp_v is the quotient between the P_v vapour pressure and the liquid's specific weight.

0,5 is the safety factor.

The maximum possible suction head for installation depends on the value of the atmospheric pressure (i.e. the elevation above sea level at which the pump is installed) and the temperature of the liquid.

To help the user, with reference to water temperature (4°C) and to the elevation above sea level, the following tables show the drop in hydraulic pressure head in relation to the elevation above sea level, and the suction loss in relation to temperature.

Water temperature (°C)	20	40	60	80	90	110	120
Suction loss (m)	0,2	0,7	2,0	5,0	7,4	15,4	21,5
Elevation above sea level (m)	500	1000	1500	2000	2500	3000	
Suction loss (m)	0,55	1,1	1,65	2,2	2,75	3,3	

Friction loss is shown in the tables at pages 152-153 of this catalogue. To reduce it to a minimum, especially in cases of high suction head (over 4-5 m.) or within the operating limits with high flow rates, we recommend using a suction line having a larger diameter than that of the pump's suction port. It is always a good idea to position the pump as close as possible to the liquid to be pumped.

Make the following calculation:

Liquid: water at ~15°C $\gamma = 1 \text{ kg/dm}^3$

Flow rate required: $30 \text{ m}^3/\text{h}$

Head for required delivery: 43 m.

Suction lift: 3,5 m.

The selection is an FHE 40-200/75 pump whose NPSH required value is, at $30 \text{ m}^3/\text{h}$, $di = 2,5 \text{ m}$.

For water at 15 °C

$hp = Pa / \gamma = 10,33 \text{ m}$, $hp_v = Pv / \gamma = 0,174 \text{ m}$ (0,01701 bar)

The Hf flow resistance in the suction line with foot valves is ~ 1,2 m.

By substituting the parameters in formula ① with the numeric values above, we have:

$$10,33 + (-3,5) \geq (2,5 + 0,5) + 1,2 + 0,17$$

from which we have: $6,8 > 4,4$

The relation is therefore verified.

CHOOSING AND SIZING THE SURGE TANK

The purpose of the surge tank is to limit the number of hourly starts of the pumps, placing part of its stock of water, which is maintained under pressure by the air above it, at the disposal of the system.

The surge tank can be of the air cushion or diaphragm type.

In the air cushion version there is no clear separation between air and water. Since part of the air tends to mix with water, it is necessary to restore it by means of air supply units or a compressor.

In the diaphragm version, neither air supply units nor compressor are needed, as contact between air and water is prevented by a flexible diaphragm inside the tank.

The following method, which is used to determine the volume of a surge tank, is valid both for horizontal and vertical surge tanks.

When calculating the volume of the surge tank, it is generally sufficient to consider the first pump only.

AIR-CUSHION SURGE TANK

It is determined in relation to flow rate, pump pressure, and number of starts per hour allowed by the motor.

$$V_a = \frac{1,25 \times Q_p \times (P_{max} + 10)}{4 \times Z \times (P_{max} - P_{min})}$$

where:

V_a = Total volume of the air-cushion surge tank in m³
 Q_p = Average pump flow rate in m³/h
 P_{max} = Maximum pressure setting (wcm)
 P_{min} = Minimum pressure setting (wcm)
 Z = Maximum number of starts per hour allowed by the motor

Warning! By pump flow rate we mean the average between the flow rate at the maximum pressure switch setting (Q_{max}) and the flow rate at the minimum pressure switch setting (Q_{min}), i.e.:

$$Q_p = \frac{Q_{max} + Q_{min}}{2} \text{ (m}^3\text{/h)}$$

Example:

CN 32 - 160/22 pump
 $P_{max} = 32$ mca
 $P_{min} = 22$ mca
 $Q_p = 18$ m³/h
 $Z = 30$

$$V_a = \frac{1,25 \times 18 \times (32 + 10)}{4 \times 30 \times (32 - 22)} = 0,788 \text{ m}^3$$

A 750-litre surge tank is therefore required.

DIAPHRAGM TANK

If you decide to use a diaphragm tank, the volume will be lower than that of the air-cushion tank. It can be calculated with the following formula:

$$V_m = \frac{Q_p}{4 \times Z} \times \frac{1}{1 - \frac{(P_{min} - 2)}{P_{max}}}$$

where:

V_m = Total volume of the air-cushion surge tank in m³
 Q_p = Average pump flow rate in m³/h
 P_{max} = Maximum pressure setting (wcm)
 P_{min} = Minimum pressure setting (wcm)
 Z = Maximum number of starts per hour allowed by the motor

Example:

CN 32 - 160/22 pump

$P_{max} = 32$ mca
 $P_{min} = 22$ mca
 $Q_p = 18$ m³/h
 $Z = 30$

$$V_m = \frac{Q_p}{4 \times Z} \times \frac{1}{1 - \frac{(P_{min} - 2)}{P_{max}}} = 0,4 \text{ m}^3$$

A 500-litre surge tank is therefore required.

Approximate comparison between Lowara air-cushion tanks and diaphragm tanks, as regards some pressure switch setting values

The hr values must be multiplied by:
0,71 for galvanized or painted steel pipes
0,54 for stainless steel or copper pipes
0,47 for PVC or PE pipes

hr = flow resistance for 100 m of straight pipeline (m)
V = water speed (m/s)

G-at-pct-en_a_th

FLOW RESISTANCE

TABLE OF FLOW RESISTANCE IN BENDS, VALVES AND GATES

The flow resistance is calculated using the equivalent pipeline length method according to the table below:

ACCESSORY TYPE	DN											
	25	32	40	50	65	80	100	125	150	200	250	300
	Equivalent pipeline length (m)											
45° bend	0,2	0,2	0,4	0,4	0,6	0,6	0,9	1,1	1,5	1,9	2,4	2,8
90° bend	0,4	0,6	0,9	1,1	1,3	1,5	2,1	2,6	3,0	3,9	4,7	5,8
90° smooth bend	0,4	0,4	0,4	0,6	0,9	1,1	1,3	1,7	1,9	2,8	3,4	3,9

G-a-pcv-en_a_th

The table is valid for the Hazen Williams coefficient C=100 (cast iron pipework);
for steel pipework, multiply the values by 1,41;
for stainless steel, copper and coated cast iron pipework, multiply the values by 1,85;
When the **equivalent pipeline length** has been determined, the flow resistance is obtained from the table of flow resistance.
The values given are guideline values which are bound to vary slightly according to the model, especially for gate valves and non-return valves, for which it is a good idea to check the values supplied by manufacturers.

Air supply unit

The most commonly used air supply unit model is the "depression" type, which uses the depression produced by the pump suction.

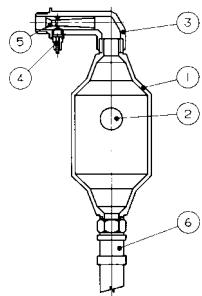

fig. 7.2.2 - The air supply unit consists of a body made of plastic material suitable for foodstuffs (1), a spherical rubber shutter (2), an upper brass union (3) with an air valve (4), a Venturi tube (5), and a flexible pipe (6) to be connected to the pump intake.

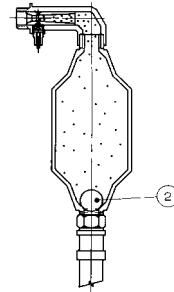

fig. 7.2.5 - The air accumulated inside the body pushes the rubber ball (2) to the bottom, thus blocking the passage. At this point the valve closes and the rubber ball prevents the air accumulated inside the body of the air supply unit from reaching the pump intake.

Air supply unit operation

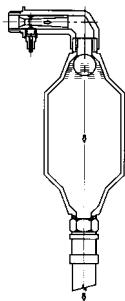

fig. 7.2.3 - When the pump starts up, the intake pressure is lower than the pressure in the surge tank. This difference causes water to flow from the surge tank to the pump intake, through the air supply unit.

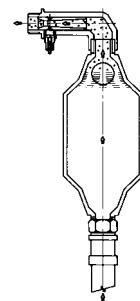

fig. 7.2.6 - When the pump stops the depression ceases and a flow of water is produced, which lifts the ball and pushes the air in the body of the supply unit into the tank.

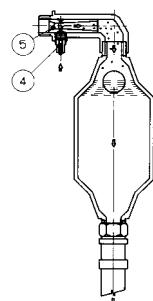

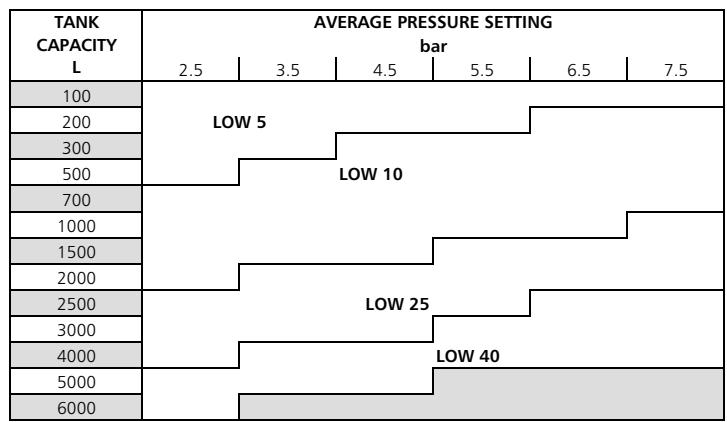

fig. 7.2.4 - The flow of water that passes through the Venturi tube (5) generates a depression and allows the opening of the air valve (4). As a consequence, air enters the body of the supply unit.

Air supply unit selection tank

This cycle is repeated each time the pump starts up until the required quantity of air has accumulated. To ensure proper system operation, no check valve must be mounted between the pump delivery outlet and the surge tank, as it would impede the return flow of water through the pump.

FURTHER PRODUCT SELECTION AND DOCUMENTATION

Xylect™

Xylect™ is pump solution selection software with an extensive online database of product information across the entire Lowara, and Vogel range of pumps and related products, with multiple search options and helpful project management facilities. The system holds up-to-date product information on thousands of products and accessories.

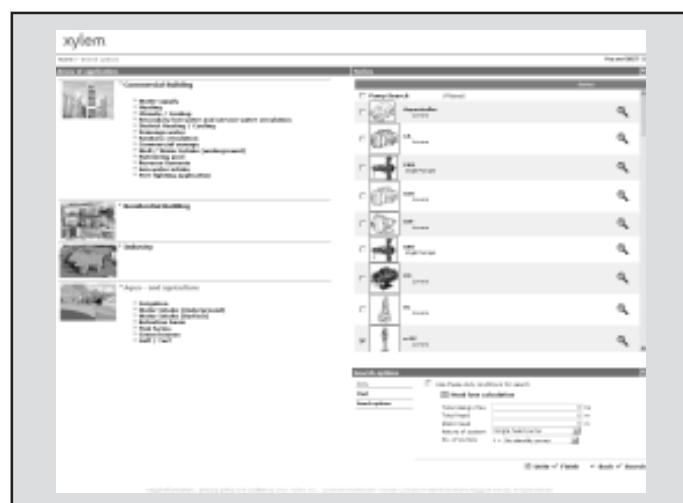

The possibility to search by applications and the detailed information output given makes it easy to make the optimal selection without having detailed knowledge about the Lowara and Vogel products.

The search can be made by:

- Application
- Product type
- Duty point

Xylect™ gives a detailed output:

- List with search results
- Performance curves (flow, head, power, efficiency, NPSH)
- Motor data
- Dimensional drawings
- Options
- Data sheet printouts
- Document downloads incl dxf files

The search by application guides users not familiar with the product range to the right choice.

FURTHER PRODUCT SELECTION AND DOCUMENTATION

Xylect™

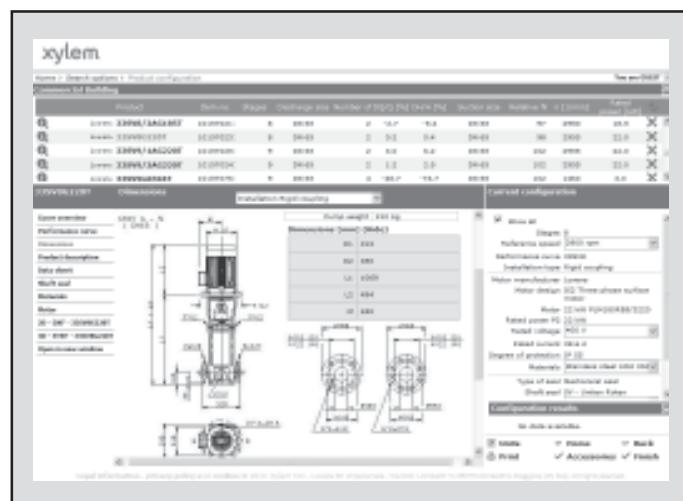

The detailed output makes it easy to select the optimal pump from the given alternatives.

The best way to work with Xylect™ is to create a personal account. This makes it possible to:

- Set own standard units
- Create and save projects
- Share projects with other Xylect™ users

Every user have a My Xylect space, where all projects are saved.

For more information about Xylect™ please contact our sales network or visit www.xylect.com.

Dimensional drawings appear on the screen and can be downloaded in dxf format.

Xylem |'ziləm|

- 1) The tissue in plants that brings water upward from the roots;
- 2) a leading global water technology company.

We're approximately 12,900 people unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.
